| 4.5 Bump size .....  | 18        |
| <b>5. Interface.....</b>   | <b>19</b> |
| 5.1 System interface.....  | 19        |
| 5.1.1 Parallel bus system interface.....   | 20        |
| 5.1.2 MCU data color coding .....  | 27        |
| 5.1.3 Serial Interface .....   | 36        |
| 5.1.4 Display module data transfer recovery.....   | 40        |
| 5.1.5 Display module data transfer pause.....  | 41        |
| 5.1.6 Display module data transfer modes.....  | 42        |
| 5.2 Color depth conversion.....  | 43        |
| <b>6. Display Data GRAM.....</b>   | <b>47</b> |
| 6.1 Display data GRAM mapping .....  | 47        |
| 6.2 Address counter (AC) of GRAM .....   | 47        |
| 6.2.1 System interface to GRAM write direction.....  | 48        |
| 6.3 Source, gate and memory map .....  | 53        |
| 6.3.1 When using 132 x 162 GRAM resolution, display resolution 132RGB x 162 (RSO[2:0]=3'b000 & STE_SEL=0)..... | 53        |
| 6.3.2 When using 132 x 162 GRAM resolution, display resolution 128RGB x 160 (RSO[2:0]=3'b000 & STE_SEL=1)..... | 54        |
| 6.3.3 When using 128 x 128 GRAM resolution, display resolution 128RGB x 128 (RSO[2:0]=3'b001) .....            | 55        |
| 6.3.4 When using 120 x 160 GRAM resolution, display resolution 120RGB x 160 (RSO[2:0]=3'b010).....             | 56        |
| 6.3.5 When using 128 x 160 GRAM resolution, display resolution 128RGB x 160 (RSO[2:0]=3'b011) .....            | 57        |
| 6.3.6 When using 96 x 68 GRAM resolution, display resolution 96RGB x 68 (RSO[2:0]=3'b100).....                 | 58        |
| 6.3.7 When using 96 x 64 GRAM resolution, display resolution 96RGB x 64 (RSO[2:0]=3'b101).....                 | 59        |
| 6.3.8 Normal display on or partial display on .....  | 60        |
| 6.4 Vertical scrolling display .....   | 74        |
| <b>7. Functional Description .....</b>   | <b>76</b> |
| 7.1 Internal Oscillator.....   | 76        |
| 7.2 Gamma characteristic correction function .....   | 77        |
| 7.2.1 Structure of grayscale voltage generator.....  | 78        |
| 7.2.2 Gamma-characteristics adjustment register.....   | 79        |
| 7.2.3 Gamma resister stream and 8 to 1 selector .....  | 80        |
| 7.2.4 Variable resister .....  | 83        |
| 7.3 Tearing effect output line .....   | 89        |
| 7.3.1 Tearing effect line modes.....   | 89        |
| 7.3.2 Tearing effect line timing.....  | 91        |
| 7.3.3 Example 1: MPU write is faster than panel read .....   | 92        |
| 7.3.4 Example 2: MPU write is slower than panel read.....  | 93        |
| 7.4 Scan Mode Setting .....  | 93        |
| 7.5 LCD power generation circuit .....   | 94        |
| 7.5.1 Power supply circuit.....  | 94        |
| 7.5.2 LCD power generation scheme.....   | 95        |
| 7.6 Power function .....   | 96        |

|           |   |            |
|-----------|---|------------|
| 7.6.1     | Power on/off sequence .....   | 96         |
| 7.6.2     | Power levels definition .....   | 99         |
| 7.6.3     | Deep standby mode set up flow .....                                       | 100        |
| 7.7       | Sleep out – command and self-diagnostic functions of display module ..... | 101        |
| 7.7.1     | Register loading detection .....  | 101        |
| 7.7.2     | Functionality detection .....   | 102        |
| 7.8       | Input / output pin state .....  | 103        |
| 7.8.1     | Output pins .....   | 103        |
| 7.8.2     | Input pins .....  | 103        |
| <b>8.</b> | <b>Command Set .....</b>  | <b>104</b> |
| 8.1       | Command set list .....  | 104        |
| 8.2       | Command description .....   | 109        |
| 8.2.1     | NOP .....   | 109        |
| 8.2.2     | Software reset (01h) .....  | 110        |
| 8.2.3     | Read display identification information (04h) .....                       | 111        |
| 8.2.4     | Read display status (09h) .....   | 112        |
| 8.2.5     | Read display power mode (0Ah) .....                                       | 115        |
| 8.2.6     | Read display MADCTL (0Bh) .....   | 117        |
| 8.2.7     | Read display pixel format (0Ch) .....                                     | 119        |
| 8.2.8     | Read display image mode (0Dh) .....                                       | 121        |
| 8.2.9     | Read display signal mode (0Eh) .....                                      | 123        |
| 8.2.10    | Read display self-diagnostic result (0Fh) .....                           | 124        |
| 8.2.11    | Sleep in (10h) .....  | 125        |
| 8.2.12    | Sleep out (11h) .....   | 126        |
| 8.2.13    | Partial mode on (12h) .....   | 128        |
| 8.2.14    | Normal display mode on (13h) .....  | 129        |
| 8.2.15    | Display inversion off (20h) .....   | 130        |
| 8.2.16    | Display inversion on (21h) .....  | 131        |
| 8.2.17    | Gamma set (26h) .....   | 132        |
| 8.2.18    | Display off (28h) .....   | 133        |
| 8.2.19    | Display on (29h) .....  | 134        |
| 8.2.20    | Column address set (2Ah) .....  | 135        |
| 8.2.21    | Page address set (2Bh) .....  | 137        |
| 8.2.22    | Memory write (2Ch) .....  | 139        |
| 8.2.23    | Color set (2Dh) .....   | 140        |
| 8.2.24    | Memory read (2Eh) .....   | 141        |
| 8.2.25    | Partial area (30h) .....  | 142        |
| 8.2.26    | Vertical scrolling definition (33h) .....                                 | 144        |
| 8.2.27    | Tearing effect line off (34h) .....                                       | 147        |
| 8.2.28    | Tearing effect line on (35h) .....  | 148        |
| 8.2.29    | Memory access control (36h) .....   | 149        |
| 8.2.30    | Vertical scrolling start address (37h) .....                              | 151        |
| 8.2.31    | Idle mode off (38h) .....   | 152        |
| 8.2.32    | Idle mode on (39h) .....  | 153        |
| 8.2.33    | Interface pixel format (3Ah) .....  | 154        |
| 8.2.34    | Read ID1 (DAh) .....  | 155        |
| 8.2.35    | Read ID2 (DBh) .....  | 156        |
| 8.2.36    | Read ID3 (DCh) .....  | 157        |
| 8.2.37    | SETOSC: set internal oscillator (B0h) .....                               | 158        |
| 8.2.38    | SETPOWER: set power (B1h) .....   | 159        |
| 8.2.39    | SETDISPLAY: set display related register (B2h) .....                      | 162        |
| 8.2.40    | SETCYC: set display cycle register (B4h) .....                            | 164        |
| 8.2.41    | SETBGP: set internal reference voltage register (B5h) .....               | 167        |
| 8.2.42    | SETCOM: set VCOM voltage related register (B6h) .....                     | 169        |
| 8.2.43    | SETEXTC: enable extension command (B9h) .....                             | 170        |

|            |  |            |
|------------|--|------------|
| 8.2.44     | SETOTP: set OTP setting (BBh)  | 171        |

## >> **HX8353-E**

132RGB x 162 dot, 262K Color, with Internal GRAM, TFT Mobile Single Chip Driver

Himax Technologies, Inc.  
<http://www.himax.com.tw>

***Preliminary Version 0.1***

*April, 2012*

### **1. General Description**

This manual describes the Himax's HX8353-E 132RGB\*162 dots resolution driving controller. The HX8353-E is designed to provide a single-chip solution that combined a gate driver, a source driver, **power supply circuit**, and internal graphics RAM for **262,144 colors** to drive a TFT panel with 132RGB\*162 dots at maximum.

The HX8353-E can be operated in low-voltage condition to the interface and integrated internal boosters that produce the liquid crystal voltage, **breeder resistance** and the voltage follower circuit for liquid crystal driver. In addition, The HX8353-E also supports various functions to reduce the power consumption of a LCD system via software control.

The HX8353-E is suitable for any small portable battery-driven product and requiring long-term driving capabilities, such as small PDAs, digital cellular phones and bi-directional pagers.

## 2. Features

- Single chip solution to drive a TFT panel
- 132RGB x 162-dot graphics display LCD controller/driver and 262,144 TFT colors
- Support resolution:
  - 132RGB x 162-dot: Display with 132 x 18-bits x 162 display RAM
  - 128RGB x 160-dot
    - Type 1: Display with 128 x 18-bits x 160 display RAM
    - Type 2: Display with 132 x 18-bits x 162 display RAM
  - 128RGB x 128-dot
  - 120RGB x 160-dot
  - 96RGB x 68-dot: Display with 96 x 18-bits x 68 display RAM
  - 96RGB x 64-dot
- Internal operation circuit of liquid crystal display:
  - Source channel: 396ch (132RGB)
  - Gate line: 162 Gate output
- Display mode (Color modes):
  - Full colors
    - 262k colors (18bit 6(R):6(G):6(B))
  - Reduce color mode:
    - 65k colors (16bit 5(R):6(G):5(B))
    - 4k colors (12bit 4(R):4(G):4(B))
    - 8 colors (Idle mode on): 8 colors (3 bit binary mode)
- Internal graphics RAM capacity: 132 x 162 x 18-bit = 0.38M bit:
- Support interface mode:
  - I80 System interface: 8-/9-/16-/18-bits bus
  - M68 System interface: 8-/9-/16- /18-bits bus
  - 3-/4- Wires Serial Data Transfer Interface
- Display features
  - Area scrolling
  - Partial display mode
  - Software programmable color depth mode
- On chip features:
  - DC/DC converter
  - OTP to store initialization register setting and MTP (Multi-time-programming)

- non-volatile memory to store for VCOM setting
- Oscillator for display clock generation
  - 1-dot/2-dot/4-dot inversion, column inversion
  - Support default value for factory use
  - Low-power consumption architecture supports:
    - Logic supply voltage range for IOVCC to VSSD: 1.65 to 3.3V
    - Analog supply voltage range for VCI to VSSA: 2.5 to 3.3V
  - Output voltage range:
    - VSP = 5.0V (VCI=2.8V) for dual pump (Power supply for driver circuit range)
    - VSN = -5.0 V for dual pump (Power supply for driver circuit range)
    - VSPROUT =3.3V to 4.6V (Positive Source output voltage range)
    - VSNROUT = -3.3V to -4.6V (Negative Source output voltage range)
    - VGH = +9.0 to +15V (Positive Gate output voltage range)
    - VGL = -6.0 to -12.5V (Negative Gate output voltage range)
    - VCOM=-2.5V to 0V
  - Low power consumption, suitable for battery operated systems
  - Suitable for all brand LCM module
    - Command set:
      - 128RGB x 160-dot
      - 132RGB x 162-dot
      - 120RGB x 160-dot
      - 96RGB x 68-dot
      - 96RGB x 64-dot
    - Himax defined command set
  - CMOS compatible inputs
  - Optimized layout for COG assembly
  - Temperature range: -30°C ~ 80°C

| DUMMYR1~R2           | -   | 2          | -              | Dummy pads. Available for measuring the COG contact resistance. DUMMYR1 and DUMMYR2 are short-circuited within the chip.   |
| LC_SEL1~0            | -   | 2          | -              | Dummy pin, let it open or pull up/down.  |

| Power Part |     |            |                |   |
|------------|-----|------------|----------------|---|
| Signals    | I/O | Pin Number | Connected with | Description   |
| IOVCC      | P   | 17         | Power supply   | Power supply for interface pin. IOVCC = 1.65 ~3.3 V.  |
| VSSD       | P   | 17         | Power supply   | Ground for the logic side. VSSD = 0V  |
| VSSA       | P   | 9          | Power supply   | Analog ground. VSSA = 0V. When using the COG method, connect to VSSD on the FPC to prevent noise. |
| VCI        | P   | 6          | Power supply   | A power supply for the analog circuit. VCI = 2.5 ~ 3.3V   |

**4.2 Pin assignment**

Chip size : 10100um x 655um  
 (Include Seal-ring and Scribe line)

Chip thickness : 250um(typ.)/350um  
 Pad coordinate : PAD center  
 Coordinate Origin : Chip Center  
 Au Bump Size  
 Bump height tolerance +/- 3um  
 Bump size tolerance :

Output bump width : 16 +/- 2um  
 Output bump length : 98 +/- 3um  
 Input bump width : 35/40 +/- 3um  
 Input bump length : 90 +/- 3um

Numbers in the figure corresponds to pad coordinate numbers

Alignment Mark  
 Arrangement : Two places  
 A1 : Coordinate(X,Y)=(-4841,-220)  
 A2 : Coordinate(X,Y)=(4841,-220)

## 5. Interface

### 5.1 System interface

The HX8353-E supports parallel 80-system and 68-system 18-/16-/9-/8-bits bus interface mode and 3-/4- wires serial interface mode. When NCS = "L", the parallel and serial bus system interface of the HX8353-E become active and data transfer through the interface circuit is available. The DNC\_SCL pin specifies whether the system interface circuit access is to the register command or to the GRAM. The input bus width format of system interface circuit is selected by external pins BS2-0. For selecting the format of input bus, please refer to Table 5.1 and Table 5.2.

The HX8353-E includes command code and the following parameter and GRAM data. The command code can be written through data bus by setting DNC\_SCL=0. Then the command or GRAM data can be written to register at which that index pointer pointed by setting DNC\_SCL=1.

Furthermore, there are two 18-bit bus control registers used to temporarily store the data written to or read from the GRAM. When the data is written into the GRAM from the MPU, it is first written into the write-data latch and then automatically written into the GRAM by internal operation. Data is read through the read-data latch when reading from the GRAM. Therefore, the first read data operation is invalid and the following read data operations are valid.

| SPI_SEL | P68 | BS2 | BS1 | BS0 | Interface                    |
|---------|-----|-----|-----|-----|------------------------------|
| x       | 0   | 1   | 0   | 0   | 80-system 8-bit Parallel     |
| x       | 0   | 1   | 0   | 1   | 80-system 16-bit Parallel    |
| x       | 0   | 1   | 1   | 0   | 80-system 9-bit Parallel     |
| x       | 0   | 1   | 1   | 1   | 80-system 18-bit Parallel    |
| x       | 1   | 1   | 0   | 0   | 68-system 8-bit Parallel     |
| x       | 1   | 1   | 0   | 1   | 68-system 16-bit Parallel    |
| x       | 1   | 1   | 1   | 0   | 68-system 9-bit Parallel     |
| x       | 1   | 1   | 1   | 1   | 68-system 18-bit Parallel    |
| 0       | x   | 0   | x   | x   | 3 wire serial Interface only |
| 1       | x   | 0   | x   | x   | 4 wire serial Interface only |

| 68-system 16-bit Parallel | E     | RW      | DNC     | DB7-DB0           | DB15-DB0 |
| 68-system 18-bit Parallel | E     | RW      | DNC     | DB7-DB0           | DB17-DB0 |
| 4 wire serial Interface   | -     | DNC     | SCL     | DB0 as SDA        |          |

**Table 5.2 Interface mode selection**

### 5.1.1 Parallel bus system interface

The input / output data from data pins (DB17-0) and signal operation of the I80/M68 series parallel bus interface as listed in Table 5.3 and Table 5.4.

| Operations                                      | NWR_RNW | NRD_E | DNC_SCL |
|---|---------|-------|---------|
| Writes command code                             | 0       | 1     | 0       |
| Reads internal status                           | 1       | 0     | 0       |
| Writes parameter into command or data into GRAM | 0       | 1     | 1       |
| Reads parameter from command or data from GRAM  | 1       | 0     | 1       |

**Table 5.3 Data pin function for I80 series CPU**

| Operations                                      | NWR_RNW | NRD_E | DNC_SCL |
|---|---------|-------|---------|
| Writes command code                             | 0       | 1     | 0       |
| Reads internal status                           | 1       | 1     | 0       |
| Writes parameter into command or data into GRAM | 0       | 1     | 1       |
| Reads parameter from command or data from GRAM  | 1       | 1     | 1       |

**8-bit bus interface**

The I80-system 8-bit parallel bus interface can be used by setting external pins “P68, BS2, BS1, BS0” pins to “0100”. And the M68-system 8-bit parallel bus interface can be used by setting “P68, BS2, BS1, and BS0” pins to “1100”. Figure 5.7 is the example of interface with I80/M68 microcomputer system interface and Figure 5.8 ~Figure 5.10 is bit format per pixel color order.

**16-bit parallel bus system interface**

The I80-system 16-bit parallel bus interface in command-parameter interface mode can be used by setting external pins “P68, BS2, BS1, BS0” pins to “0101”. And the M68-system 16-bit parallel bus interface in MPU interface mode can be used by setting “P68, BS2, BS1” pins to “1101”. The Figure 5.11 is the example of interface with I80/M68 microcomputer system interface. There are three types of data format to write display data at 18-bit bus Interface. See Figure 5.12 ~ Figure 5.14.

Table 5.12 18-bit parallel interface GRAM read table

### 5.1.3 Serial Interface

The HX8353-E supports serial data transfer interface. The interface selection by setting BS2=0 for serial interface mode. The 3-wires serial bus and 4-wires serial bus is select by SPI\_SEL pin. When SPI\_SEL pin is low (VSSD), it is selected by 3-wires serial bus and use: chip select line (NCS), serial input/output data (SDA), and the serial transfer clock line (DNC\_SCL). When SPI\_SEL pin is high (IOVCC), it is selected by 4-wires serial bus and use: chip select line (NCS), serial input/output data (SDA), and the serial transfer clock line (DNC\_SCL) and the command or data transfer signal (NWR\_RNW).

#### Serial data write mode

The 3-wires serial data packet contains a control bit DNC and a transmission byte, and in 4-wires serial case data packet contains just transmission byte and control bit DNC is transferred by NWR\_RNW pin. If NWR\_RNW is low, the transmission byte is command byte. If NWR\_RNW is high, the transmission byte is stored to command register or GRAM. The MSB is transmitted first. The serial interface is initialized when NCS is high. In this state, DNC\_SCL clock pulse or SDA data have no effect. A falling edge on NCS enables the serial interface and indicates the start of data transmission.

**Figure 5.19 Serial interface protocol 3-/4- wire, write mode**

**Serial data read mode**

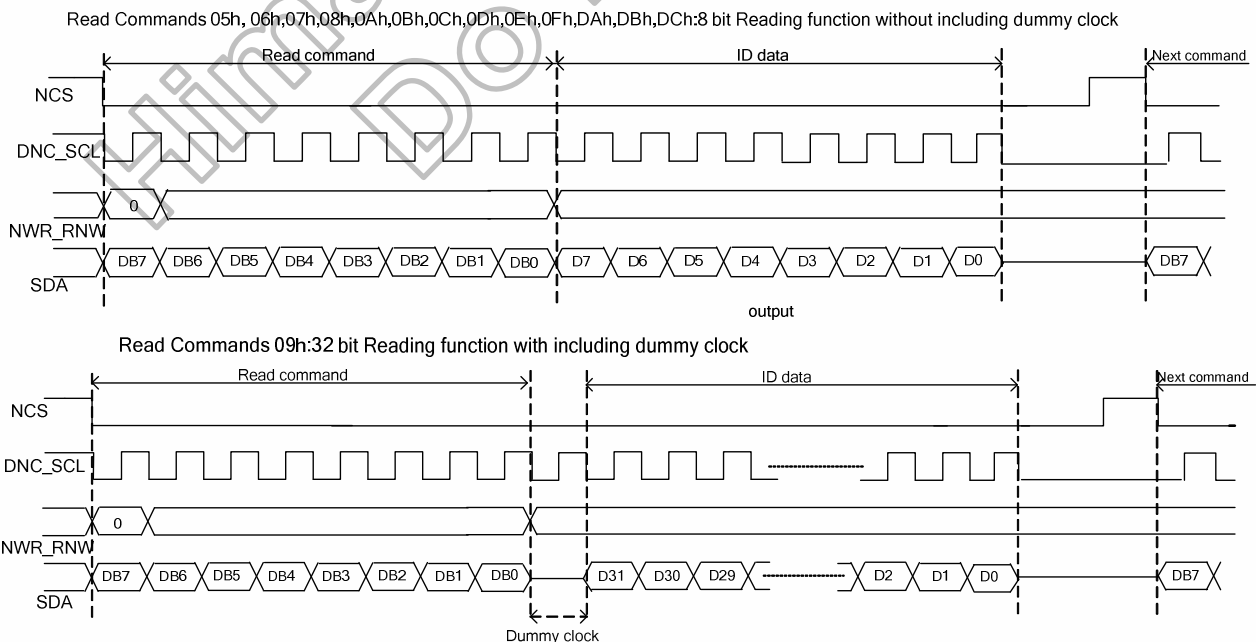

The microcontroller first has to send a command and then the following byte is transmitted in the opposite direction. The read mode has three type command data transmitted (8- / 24- / 32-bit) is according command code.

**3-Wire Serial Interface Protocol**

**Figure 5.20 3-wire serial interface protocol, read mode**

**4-Wire Serial Interface Protocol**

**Figure 5.21 4-wire serial interface protocol, read mode**

The data format that write display data to SRAM at Serial data bus Interface is shown as Figure5. 22 ~ Figure5. 27.

Figure 5.22 3-wire serial write data for RGB (6-6-6) bit input

Figure 5.23 3-wire serial write data for RGB 4-4-4-bit input

Figure 5.24 3-wire serial write data for RGB 5-6-5-bit input

Figure 5.25 4-wire serial write data for RGB (6-6-6) bit input

Figure 5.26 4-wire serial write data for RGB 4-4-4-bit input

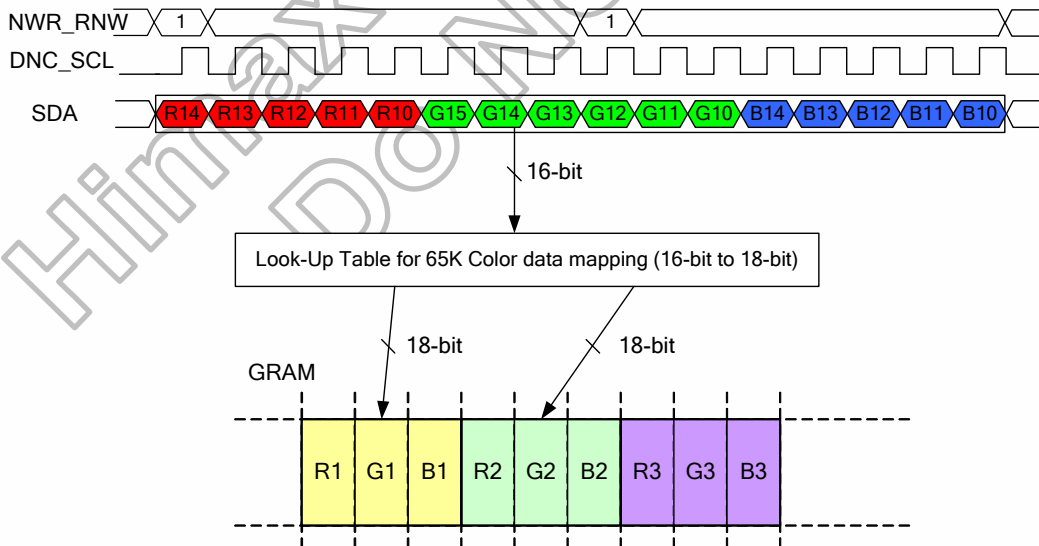

Figure 5.27 4-wire serial write data for RGB 5-6-5-bit input

### 5.1.4 Display module data transfer recovery

If there is a break on data transmission when transmitting a command before a whole byte has been completed, then the display module will reset the interface so that it will be ready to receive the same byte re-transmitted when the chip select line (NCS) is next activated. See the following figure.

**Figure 5.28 Display module data transfer recovery**

If 1 or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than re-transmitting the parameter that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown:

### 5.1.5 Display module data transfer pause

It will be possible when transferring a Command, Frame Memory Data or Multiple Parameter Data to invoke a pause in the data transmission. If the Chip Select Line is released after a whole byte of a Frame Memory Data or Multiple Parameter Data has been completed, then the Display Module will wait and continue the Frame Memory Data or Parameter Data Transmission from the point where it was paused. If the Chip Select Line is released after a whole byte of a command has been completed, then the Display Module will receive either the command's parameters (if appropriate) or a new command when the Chip Select Line is next enabled as shown below:

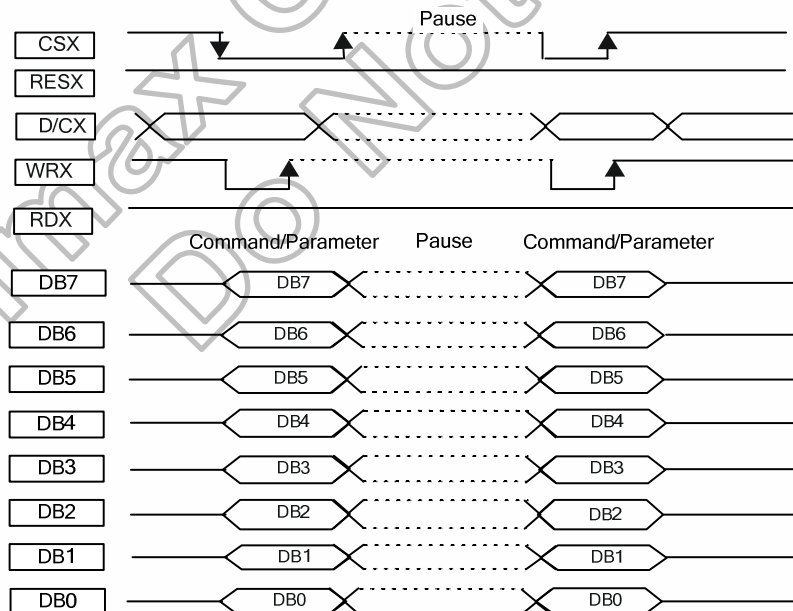

#### Serial interface pause

This applies to the following 4 conditions:

- a. Command-Pause-Command
- b. Command-Pause-Parameter
- c. Parameter-Pause-Command
- d. Parameter-Pause-Parameter

#### Parallel interface pause

This applies to the following 4 conditions:

- a. Command-Pause-Command
- b. Command-Pause-Parameter
- c. Parameter-Pause-Command
- d. Parameter-Pause-Parameter

### 5.1.6 Display module data transfer modes

The Module has three colour modes for transferring data to the display RAM. These are 12-bit colour per pixel, 16-bit colour per pixel and 18-bit colour per pixel. The data format is described for each interface. Data can be downloaded to the Frame Memory by 2 methods.

**Method 1:**

The Image data is sent to the Frame Memory in successive Frame writes, each time the Frame Memory is filled, the Frame Memory pointer is reset to the start point and the next Frame is written.

**Method 2:**

Image Data is sent and at the end of each Frame Memory download, a command is sent to stop Frame Memory Write. Then Start Memory Write command is sent, and a new Frame is downloaded.

- Note:** (1) These apply to all Data Transfer Colour modes on both Serial and Parallel interfaces.  
 (2) The Frame Memory can contain both odd and even number of pixels for both Methods. Only complete pixel data will be stored in the Frame Memory.

**5.2 Color depth conversion**

## 6. Display Data GRAM

The display data RAM stores display dots and consists of 384,912 bits (132x18x162 bits). There is no restriction on access to the RAM even when the display data on the same address is loaded to DAC. There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and Interface Read or Write to the same location of the Frame Memory.

### 6.1 Display data GRAM mapping

Every pixel (18-bit) data in GRAM is located by a (Page, Column) address (Y, X). By specifying the arbitrary window address **CASET's SC, EC** and **PASET's SP, EP**, it is possible to access the GRAM by setting RAMWR or RAMRD commands from start positions of the window address.

|       |       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 0000H | 0001H | 0002H | 0003H | ----- | 0080H | 0081H | 0082H | 0083H |
| 0100H | 0101H | 0102H | 0103H | ----- | 0180H | 0181H | 0182H | 0183H |
| 0200H | 0201H | 0202H | 0203H | ----- | 0280H | 0281H | 0282H | 0283H |

Table 6.1 GRAM address for display panel position

### 6.2 Address counter (AC) of GRAM

The HX8353-E contains an address counter (AC) which assigns address for writing/reading pixel data to/from GRAM. The address pointers set the position of GRAM. Every time when a pixel data is written into the GRAM, the X address or Y address of AC will be automatically increased by 1 (or decreased by 1), which is decided by the register (**MADTCL's MV(B5), MX(B6)** and **MY(B7)** bits) setting.

To simplify the address control of GRAM access, the window address function allows for writing data only to a window area of GRAM specified by registers. After data being written to the GRAM, the AC will be increased or decreased within setting window address-range which is specified by the **CASET** (start: **SC**, end: **EC**) and the **PASET** (start: **SP**, end: **EP**). Therefore, the data can be written consecutively without thinking a data wrap by those bit function.

**6.2.1 System interface to GRAM write direction**

**Figure 6.1 Image data sending order from host**

The data is written in the order illustrated above. The counter which dictates where in the physical memory the data is to be written is controlled by **MADCTL's MV(B5), MX(B6) and MY(B7) bits setting**

**Figure 6.2 Image data writing control**

| MV | MX | MY | CASET                                   | PASET                                   |
|----|----|----|---|---|
| 0  | 0  | 0  | Direct to Physical Column Pointer       | Direct to Physical Page Pointer         |
| 0  | 0  | 1  | Direct to Physical Column Pointer       | Direct to (Y - Physical Page Pointer)   |
| 0  | 1  | 0  | Direct to (X-Physical Column Pointer)   | Direct to Physical Page Pointer         |
| 0  | 1  | 1  | Direct to (X - Physical Column Pointer) | Direct to (Y - Physical Page Pointer)   |
| 1  | 0  | 0  | Direct to Physical Page Pointer         | Direct to Physical Column Pointer       |
| 1  | 0  | 1  | Direct to (Y - Physical Page Pointer)   | Direct to Physical Column Pointer       |
| 1  | 1  | 0  | Direct to Physical Page Pointer         | Direct to (X-Physical Column Pointer)   |
| 1  | 1  | 1  | Direct to (Y - Physical Page Pointer)   | Direct to (X - Physical Column Pointer) |

**Table 6.2 CASET and PASET control for physical column/page pointers**

For each image orientation, the controls for the column and page counters apply as below:

| Condition   | Column Counter           | Page Counter           |
|---|--------------------------|------------------------|
| When RAMWR/RAMRD command is accepted.                 | Return to "Start Column" | Return to "Start Page" |
| Complete Pixel Pair Write/Read action                 | Increment by 1           | No change              |
| The Column counter value is larger than "End column." | Return to "Start Column" | Increment by 1         |
| The Page counter value is larger than "End page".     | Return to "Start Column" | Return to "Start Page" |

**Note:** Data is always written to the Frame Memory in the same order, regardless of the Memory Write Direction set by MADCTL bits B7, B6 and B5.

**Table 6.3 Rules for updating GRAM order**

Himax Confidential  
Do Not Copy

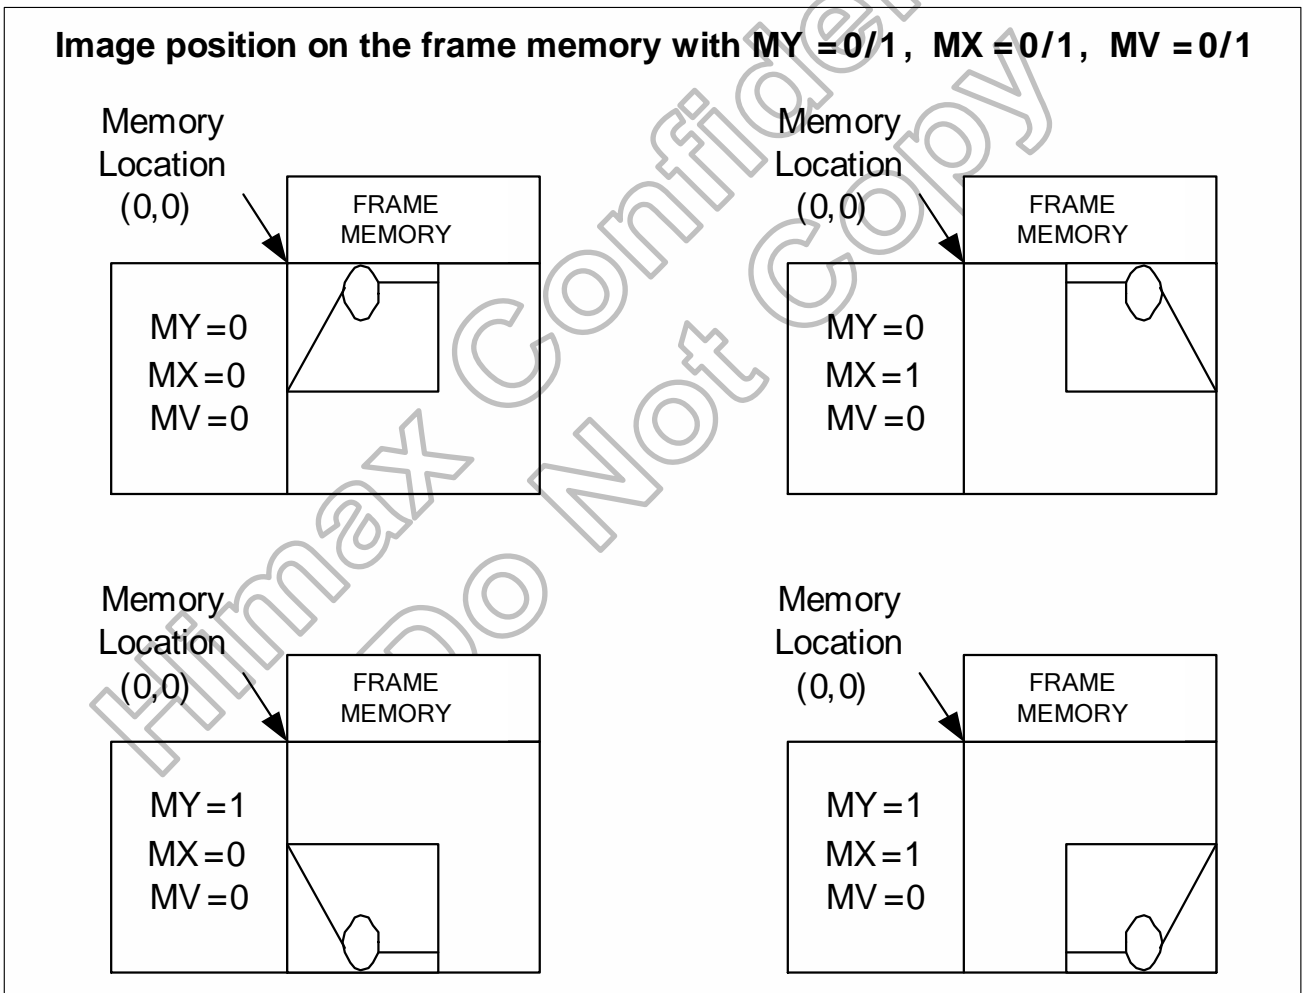

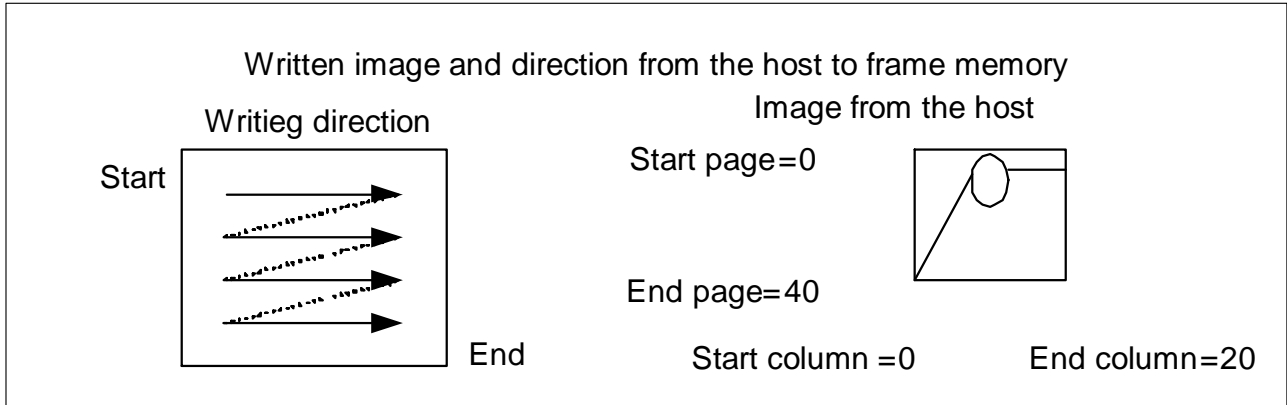

The following figure depicts the GRAM address update method with MV, MX and MY bit setting.

| Display Data Direction         | MADCTR parameter |    |    | Image in the Host | Image in the Driver (GRAM) |
|--------------------------------|------------------|----|----|-------------------|----------------------------|
|                                | MV               | MX | MY |                   |                            |
| Normal                         | 0                | 0  | 0  |                   |                            |
| Y-Invert                       | 0                | 0  | 1  |                   |                            |
| X-Invert                       | 0                | 1  | 0  |                   |                            |
| X-Invert Y-Invert              | 0                | 1  | 1  |                   |                            |
| X-Y Exchange                   | 1                | 0  | 0  |                   |                            |
| X-Y Exchange X-invert          | 1                | 0  | 1  |                   |                            |
| X-Y Exchange Y-invert          | 1                | 1  | 0  |                   |                            |
| X-Y Exchange X-invert Y-invert | 1                | 1  | 1  |                   |                            |

Table 6.4 Address direction settings

**Example for rotation with MY, MX and MV**

This example is using following values: start page=0, end page=40, start column=0 and end column=20=> commands: page address set (0, 40) and column address set (0, 20). The sent figure is as follows and its sending order is as follows.

**Figure 6.3 Example for rotation with MY, MX and MV – 1**

 ML = Scan direction parameter, DB4 parameter of MADCTL command  
 RGB= Red, Green and Blue pixel position change, DB3 parameter of MADCTL command

Figure 6.10 Memory map, 96 x 68 GRAM resolution, display resolution 96RGB x 68

6.3.7 When using 96 x 64 GRAM resolution, display resolution 96RGB x 64 (RSO[2:0]=3'b101)

**Note:** RA = Row Address,  
 CA = Column Address,  
 SA = Scan Address,  
 MX = Mirror X-axis (Column address direction parameter), DB6 parameter of MADCTL command  
 MY = Mirror Y-axis (Row address direction parameter), DB7 parameter of MADCTL command  
 ML = Scan direction parameter, DB4 parameter of MADCTL command  
 RGB= Red, Green and Blue pixel position change, DB3 parameter of MADCTL command

Figure 6.11 Memory map, 96 x 64 GRAM resolution, display resolution 96RGB x 64

**6.3.8 Normal display on or partial display on**

The HX8353-E has an internal GRAM that store 48,114 bytes pattern data, where one pixel is expressed by 18 bits.

**6.3.8.1 132X162 GRAM resolution (size) (display resolution 132RGB x 162 (RSO[2:0]=3'b000 & STE\_SEL=0))**

**(a) Normal display on**

In this mode, contents of the frame memory within an area where column pointer is 00h to 83h and page pointer is 00h to A1h is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

Table 6.6 Partial area of 132X162 GRAM resolution

**6.3.8.2 132X162 GRAM resolution (size) (display resolution 128RGB x 160 (RSO[2:0]=3'b000 & STE\_SEL=1))**

**(a) Normal display on**

In this mode, contents of the frame memory within an area where column pointer is 00h to 83h and page pointer is 00h to A1h is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

Table 6.8 Partial area of 132X162 GRAM resolution and 128X160 display resolution

**6.3.8.3 128X128 GRAM resolution (size) (display resolution 128RGB x 128 → RSO[2:0]=3'b001)**

**(a) Normal display on**

In this mode, contents of the frame memory within an area where column pointer is 00h to 7Fh and page pointer is 00h to 7Fh is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

Table 6.10 Partial area of 128X128 GRAM resolution

**6.3.8.4 120X160 GRAM resolution (size) (display resolution 120RGB x 160 → RSO[2:0]=3'b010)**

**(a) Normal display on**

In this mode, contents of the frame memory within an area where column pointer is 00h to 77h and page pointer is 00h to 9Fh is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

Table 6.12 Partial area of 120X160 GRAM resolution

**6.3.8.5 128X160 GRAM resolution (size) (display resolution 128RGB x 160 (RSO[2:0]=3'b011))**

**(a) Normal display on**

In this mode, contents of the frame memory within an area where column pointer is 00h to 7Fh and page pointer is 00h to 9Fh is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

Table 6.14 Partial area of 128X160 GRAM resolution

**6.3.8.6 96x68 Resolution (RSO[2:0]=3'b100)**

**(a) Normal display on**

In this mode, contents of the frame memory within an area where column pointer is 00h to 5Fh and page pointer is 00h to 43h is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

Table 6.16 Partial area of 96X68 GRAM resolution

**6.3.8.7 96x64 resolution (RSO[2:0]=3'b101)**

**(a) Normal display on**

In this mode, contents of the frame memory within an area where column pointer is 00h to 5Fh and page pointer is 00h to 43h is displayed. To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

### 6.4 Vertical scrolling display

The vertical scrolling display is specified by SCRLAR instruction (R33h) and VSCSAD instruction (R37h). The Vertical scrolling is only enable when using 132 x 162 GRAM resolution, display resolution 132RGB x 162 (RSO[2:0]=3'b000 & STE\_SEL=0) and display resolution 128RGB x 160 (RSO[2:0]=3'b011)

Figure 6.12 Vertical scrolling display

Himax Confidential  
Do Not Copy

When RSO[2:0]=3'b000(132RGB x 162) and Vertical Scrolling Definition Parameters (TFA+VSA+BFA)=162 (other setting is prohibited). In this case, scrolling is applied as shown below.

**Example 1: RSO=3'b000(132RGB x 162), TFA =3, VSA=157, BFA=2, VSP=4, MADCTR(ML)=0: Scrolling**

Figure 6.13 Example1 of scrolling

**Example 2: RSO=3'b000(132RGB x 162), TFA =3, VSA=157, BFA=2, VSP=4, MADCTR (ML)=1: Scrolling (TFA and BFA are exchanged)**

## 7. Functional Description

### 7.1 Internal Oscillator

The HX8353-E can oscillate an internal R-C oscillator for internal operation. Because the tolerance of internal oscillator frequency is  $\pm 5\%$ , it can be adjusted by the **RADJ [3:0]** bits for initial 6MHz internal clock generation. With other dividers setting, the 6MHz internal clock can be used to generate clock for other part of the chip using.

Figure 7.1 HX8353-E internal clock circuit

### 7.2 Gamma characteristic correction function

The HX8353-E incorporates gamma adjustment function for the 262,144-color display (64 grayscale for each R, G, B color). Gamma adjustment operation is implemented by deciding the 8 grayscale levels firstly in gamma adjustment control registers to match the LCD panel. These registers are available for both polarities.

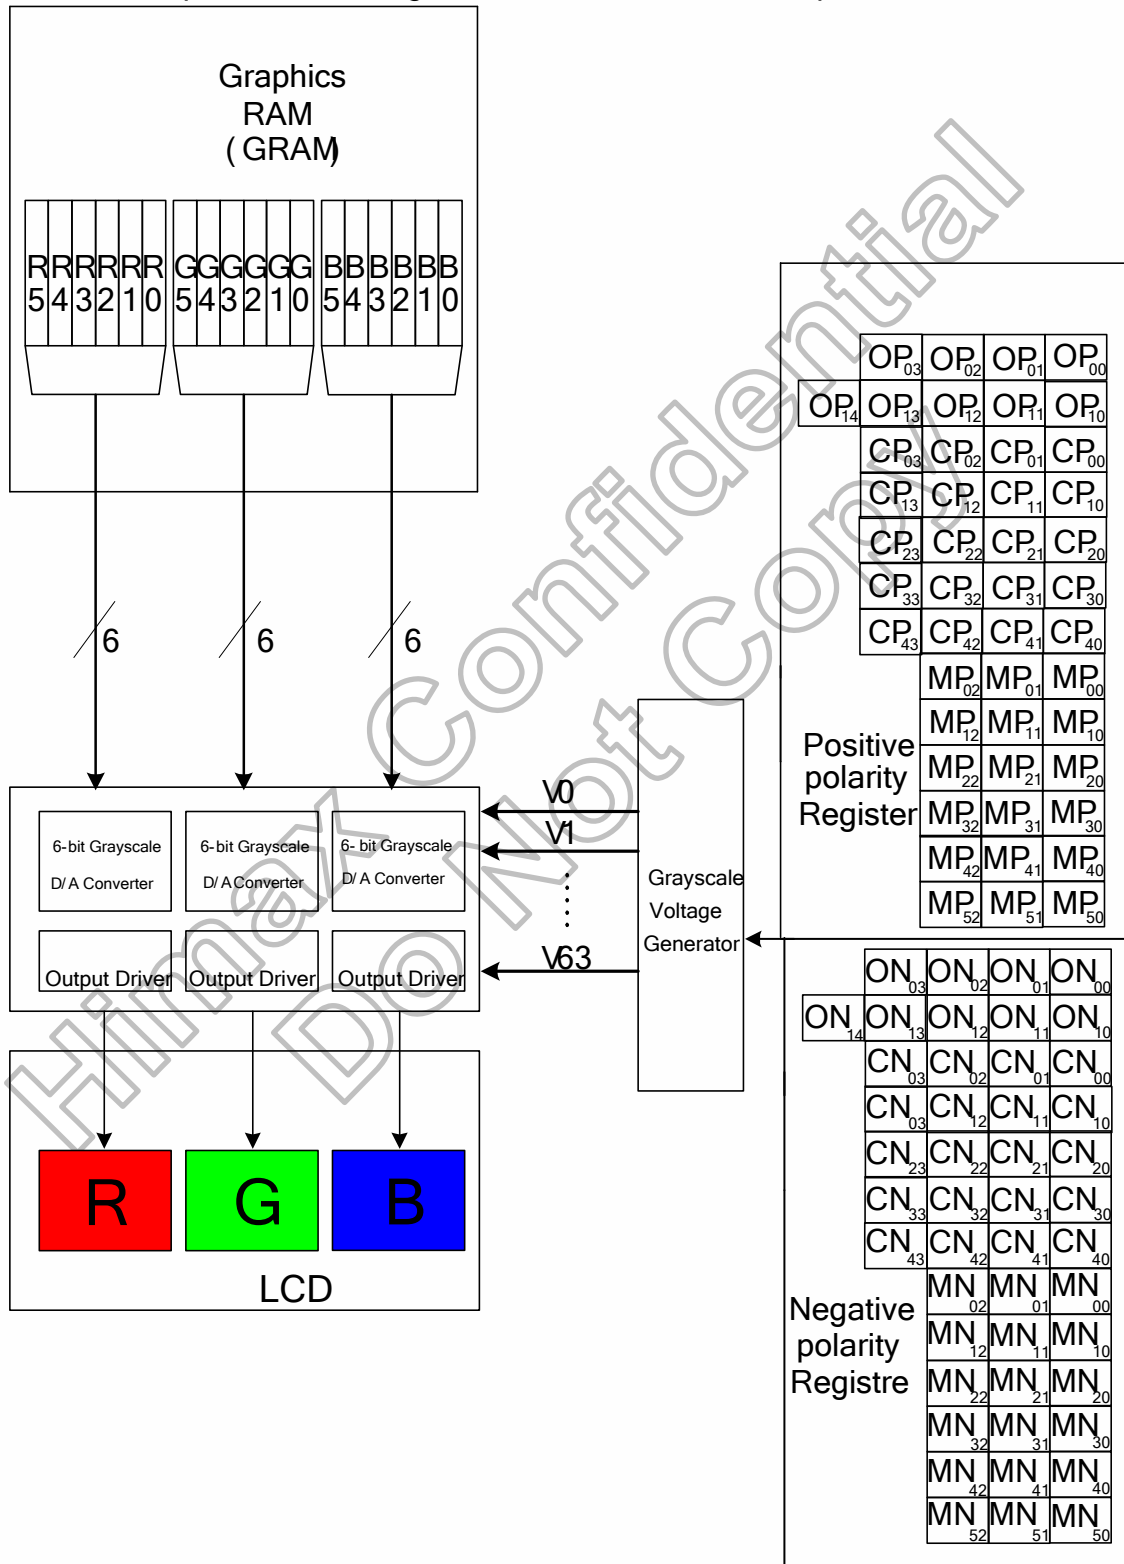

Figure 7.2 Grayscale control

### 7.2.1 Structure of grayscale voltage generator

Eight reference gamma voltages  $V_{gP/N}(0, 1, 8, 20, 43, 55, 62, 63)$  for positive and negative polarity are specified by the center adjustment, the micro adjustment and the offset adjustment registers firstly. With those eight voltage injected into specified node of grayscale voltage generator, totally 64 grayscale voltages ( $V_0-V_{63}$ ) can be generated from grayscale amplifier for LCD panel.

Figure 7.3 Structure of grayscale voltage Positive and Negative Generator

### 7.2.2 Gamma-characteristics adjustment register

This HX8353-E has register groups for specifying a series grayscale voltage that meets the Gamma-characteristics for the LCD panel. These registers are divided into two groups, which correspond to the gradient, amplitude, and macro adjustment of the voltage for the grayscale characteristics. The polarity of each register can be specified independently. (R, G, and B are common.)

**7.2.2.1 Offset adjustment registers 0/1**

The offset adjustment variable registers are used to adjust the amplitude of the grayscale voltage. This function is implemented by controlling these variable resistors in the top and bottom of the gamma resistor stream for reference gamma voltage generation. These registers are available for both positive and negative polarities

**7.2.2.2 Gamma center adjustment registers**

The gamma center adjustment registers are used to adjust the reference gamma voltage in the middle level of grayscale without changing the dynamic range. This function is implemented by controlling these variable resistors in center of the gamma resistor stream for reference gamma voltage generation. These registers are available for both positive and negative polarities.

**7.2.2.3 Gamma macro adjustment registers**

The gamma macro adjustment registers can be used for fine adjustment of the reference gamma voltage. This function is implemented by controlling the 8-to-1 selectors (MP/N0~5), each of which has 8 inputs and generate one reference voltage output (RVP/N 0, 1, 8, 20, 44, 56, 63, 64). These registers are available for both positive and negative polarities.

| Register Groups   | Positive Polarity | Description   |
|-------------------|-------------------|---|
| Center Adjustment | CP/N0 3-0         | Variable resistor (VRTP/N) for center adjustment          |
|                   | CP/N1 3-0         | Variable resistor (VRCP/N0)for center adjustment          |
|                   | CP/N2 3-0         | Variable resistor (VRMP/N) for center adjustment          |
|                   | CP/N3 3-0         | Variable resistor (VRCP/N1)for center adjustment          |
|                   | CP/N4 3-0         | Variable resistor (VRBP/N)for center adjustment           |
| Macro Adjustment  | MP/N0 2-0         | 8-to-1 selector (reference voltage level of grayscale 1)  |
|                   | MP/N1 2-0         | 8-to-1 selector (reference voltage level of grayscale 8)  |
|                   | MP/N2 2-0         | 8-to-1 selector (reference voltage level of grayscale 20) |
|                   | MP/N3 2-0         | 8-to-1 selector (reference voltage level of grayscale 43) |
|                   | MP/N4 2-0         | 8-to-1 selector (reference voltage level of grayscale 55) |
| Offset Adjustment | OP/N0 3-0         | Variable resistor (VRP/N0)for offset adjustment           |
|                   | OP/N1 4-0         | Variable resistor (VRP/N1)for offset adjustment           |

**Table 7.1 Gamma-adjustment registers**

**7.2.3 Gamma resistor stream and 8 to 1 selector**

The block consists of two gamma resistor streams, one is for positive polarity and the other is for negative polarity, each one includes eight gamma reference voltages (Vg(P/N)0, 1, 8, 20, 43, 55, 62, 63).

### 7.2.4 Variable resistor

There are two types of variable resistors, one is for center adjustment and the other is for offset adjustment. The resistances are decided by setting values in the center adjustment, offset adjustment registers. Their relationship is shown as below.

| Value in Register<br>OP/N0 3-0 | Resistance<br>VRP/N0 | Value in Register<br>OP/N1 4-0 | Resistance<br>VRP/N1 |
|--------------------------------|----------------------|--------------------------------|----------------------|

Table 7.3 Center adjustment

**8 to 1 selector**

The 8 to 1 selector has eight input voltages generated by gamma resistor stream, and outputs one reference voltages selected from inputs for gamma reference voltage generation by setting value in macro adjustment register. There are six 8 to 1 selectors and the relationship is shown as below.

| Value in Register | Voltage level |           |           |           |           |           |
|-------------------|---------------|-----------|-----------|-----------|-----------|-----------|
| M(P/N) 2-0        | Vg(P/N) 1     | Vg(P/N) 2 | Vg(P/N) 3 | Vg(P/N) 4 | Vg(P/N) 5 | Vg(P/N) 6 |
| 000               | VP(N)1        | VP(N)9    | VP(N)17   | VP(N)25   | VP(N)33   | VP(N)41   |
| 001               | VP(N)2        | VP(N)10   | VP(N)18   | VP(N)26   | VP(N)34   | VP(N)42   |
| 010               | VP(N)3        | VP(N)11   | VP(N)19   | VP(N)27   | VP(N)35   | VP(N)43   |
| 011               | VP(N)4        | VP(N)12   | VP(N)20   | VP(N)28   | VP(N)36   | VP(N)44   |
| 100               | VP(N)5        | VP(N)13   | VP(N)21   | VP(N)29   | VP(N)37   | VP(N)45   |
| 101               | VP(N)6        | VP(N)14   | VP(N)22   | VP(N)30   | VP(N)38   | VP(N)46   |
| 110               | VP(N)7        | VP(N)15   | VP(N)23   | VP(N)31   | VP(N)39   | VP(N)47   |
| 111               | VP(N)8        | VP(N)16   | VP(N)24   | VP(N)32   | VP(N)40   | VP(N)48   |

**Table 7.4 Output voltage of 8 to 1 selector**

The grayscale levels are determined by the following formulas.

| Reference Voltage | Formula       |  |
|-------------------|---------------|--|
| VgP/N0            | -             | $VSPROUT - VD * VRP / N1 / \text{sumRP} / N$   |
| VgP1/VgN7         | MP/N0 2-0=000 | $VSPROUT - VD((VRP/N1 + VRTP/N) / \text{sumRP} / N$  |
|                   | MP/N0 2-0=001 | $VSPROUT - VD((VRP/N1 + VRTP/N + 2R) / \text{sumRP} / N$   |
|                   | MP/N0 2-0=010 | $VSPROUT - VD((VRP/N1 + VRTP/N + 4R) / \text{sumRP} / N$   |
|                   | MP/N0 2-0=011 | $VSPROUT - VD((VRP/N1 + VRTP/N + 6R) / \text{sumRP} / N$   |
|                   | MP/N0 2-0=100 | $VSPROUT - VD((VRP/N1 + VRTP/N + 8R) / \text{sumRP} / N$   |
|                   | MP/N0 2-0=101 | $VSPROUT - VD((VRP/N1 + VRTP/N + 10R) / \text{sumRP} / N$  |

**GC\_SEL="H":**

Figure 7.8 Gamma curve according to GC0 to GC3 bit (GC\_SEL="H")

### 7.3 Tearing effect output line

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line off & on commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize Frame Memory Writing when displaying video images.

#### 7.3.1 Tearing effect line modes

**Mode 1:** The Tearing Effect Output signal consists of V-Blanking Information only:

$t_{vdh}$  = The LCD display is not updated from the Frame Memory  
 $t_{vdl}$  = The LCD display is updated from the Frame Memory (except Invisible Line – see below)

Figure 7.9 TE mode 1 output

**Mode 2:** The Tearing Effect Output signal consists of V-Blanking and H-Blanking Information, there is one V-sync and N H-sync pulses per field on different resolution.

128RGBx160: N=160

132RGBx162: N=162

96x68: N=68

96x64: N=64

**Figure 7.10 TE mode 2 output**

$t_{hdh}$ = The LCD display is not updated from the Frame Memory

$t_{hdl}$ = The LCD display is updated from the Frame Memory (except Invisible Line – see above.)

**Note:** During Sleep In Mode, the Tearing Output Pin is active Low.

**Figure 7.11 TE output waveform**

**7.3.2 Tearing effect line timing**

The Tearing Effect signal is described below.

**Figure 7.12 Waveform of tearing effect signal**

Idle Mode Off (Frame Rate=60Hz)

| Symbol           | Parameter                       | Min. | Max. | Unit | Description |
|------------------|---------------------------------|------|------|------|-------------|
| t <sub>vdl</sub> | Vertical Timing Low Duration    | TBD  | -    | ms   | -           |
| t <sub>vdh</sub> | Vertical Timing High Duration   | 1000 | -    | μs   | -           |
| t <sub>hdl</sub> | Horizontal Timing Low Duration  | TBD  | -    | μs   | -           |
| t <sub>hdh</sub> | Horizontal Timing High Duration | TBD  | 500  | μs   | -           |

**Table 7.8 AC characteristics of tearing effect signal**

The signal's rise and fall times (t<sub>f</sub>, t<sub>r</sub>) are stipulated to be equal to or less than 15ns.

**Figure 7.13 Timing of tearing effect signal**

The Tearing Effect Output Line is fed back to the MPU and should be used as shown below to avoid Tearing Effect:

**7.3.3 Example 1: MPU write is faster than panel read**

**Figure 7.14 Timing of MPU write is faster than panel read**

Data write to frame memory is now synchronized to the panel scan. It should be written during the vertical sync pulse of the tearing effect output line. This ensures that data is always written ahead of the panel scan and each panel frame refresh has a complete new image:

**Figure 7.15 Display of MPU write is faster than panel read**

**7.3.4 Example 2: MPU write is slower than panel read**

**Figure 7.16 Timing of MPU write is slower than panel read**

The MPU to frame memory write begins just after panel read has commenced i.e. after one horizontal sync pulse of the tearing effect output line. This allows time for the image to download behind the panel read pointer and finishing download during the subsequent frame before the read pointer “catches” the MPU to frame memory write position.

**Figure 7.17 Display of MPU write is slower than panel read**

**7.4 Scan Mode Setting**

HX8353-E can set internal register GS\_PANEL bit to determine the pin assignment of gate. The GS\_PANEL setting allows changing the shift direction of gate outputs by connecting LCD panel with the HX8353-E.

**Figure 7.18 Gate Scan Mode**

**7.5 LCD power generation circuit**

**7.5.1 Power supply circuit**

The power circuit of HX8353-E is used to generate supply voltages for LCD panel driving.

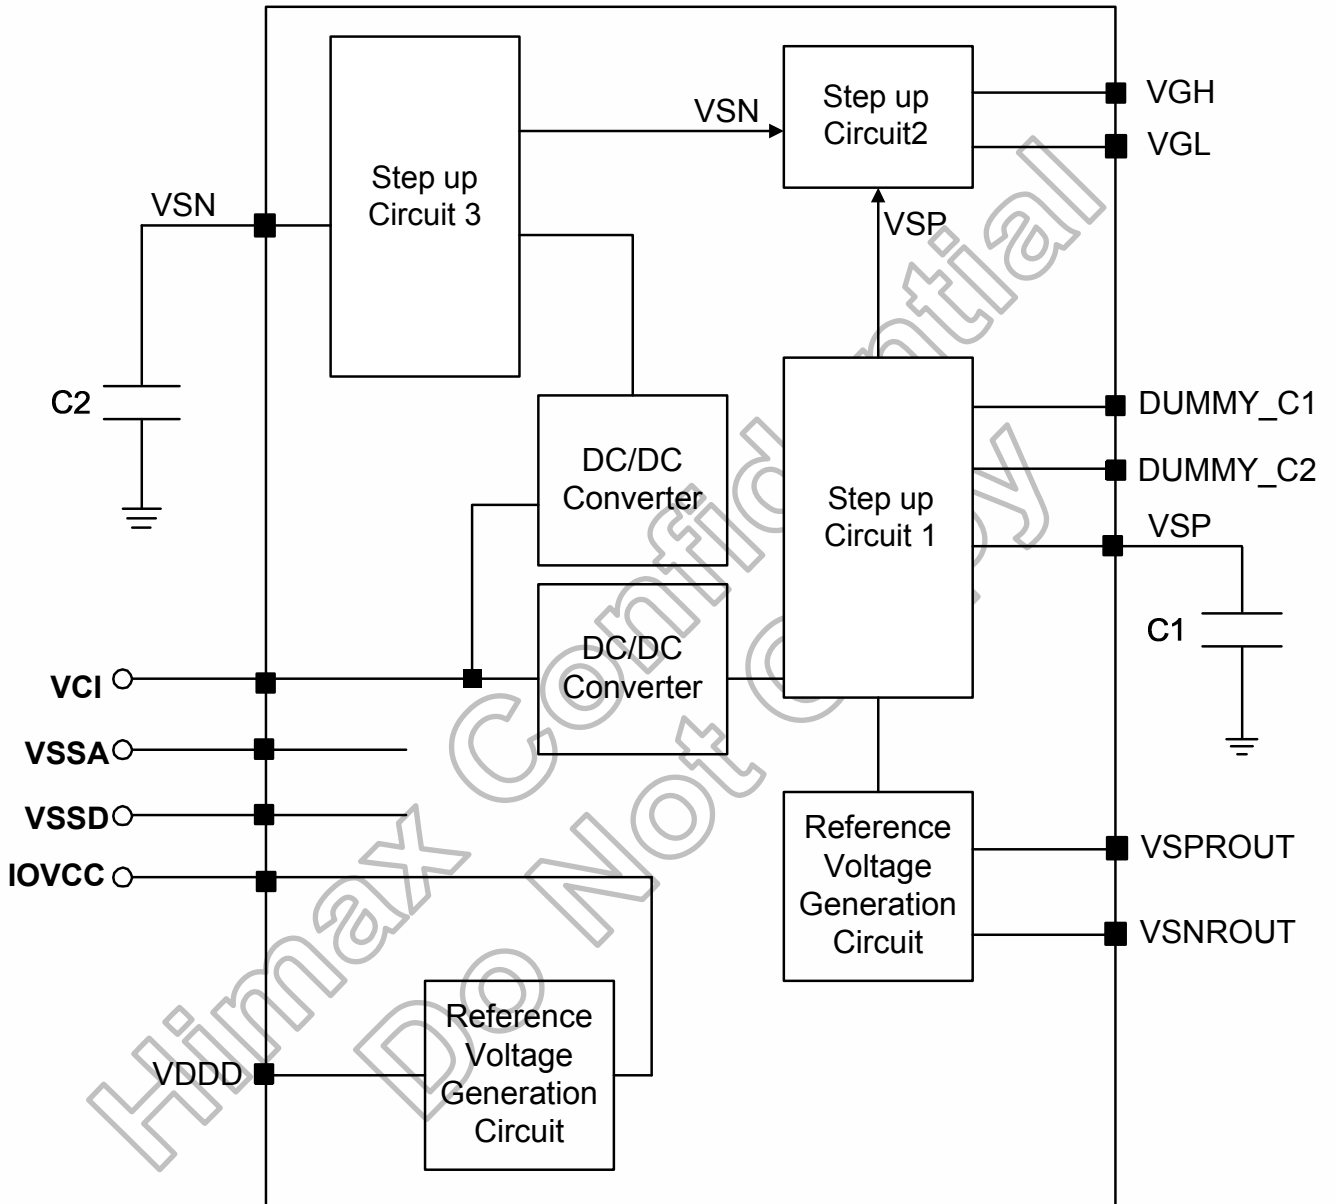

Figure 7.19 Block diagram of HX8353-E power circuit

**Specification of Connected Passive Component**

| Capacitor | Recommended voltage | Capacity                      |
|-----------|---------------------|-------------------------------|
| C1 (VSP)  | 10V                 | 1 $\mu$ F (B characteristics) |
| C2 (VSN)  | 10V                 | 1 $\mu$ F (B characteristics) |

Table 7.9 The adaptability of Capacitor

**7.5.2 LCD power generation scheme**

The boost voltage generated is shown as below.

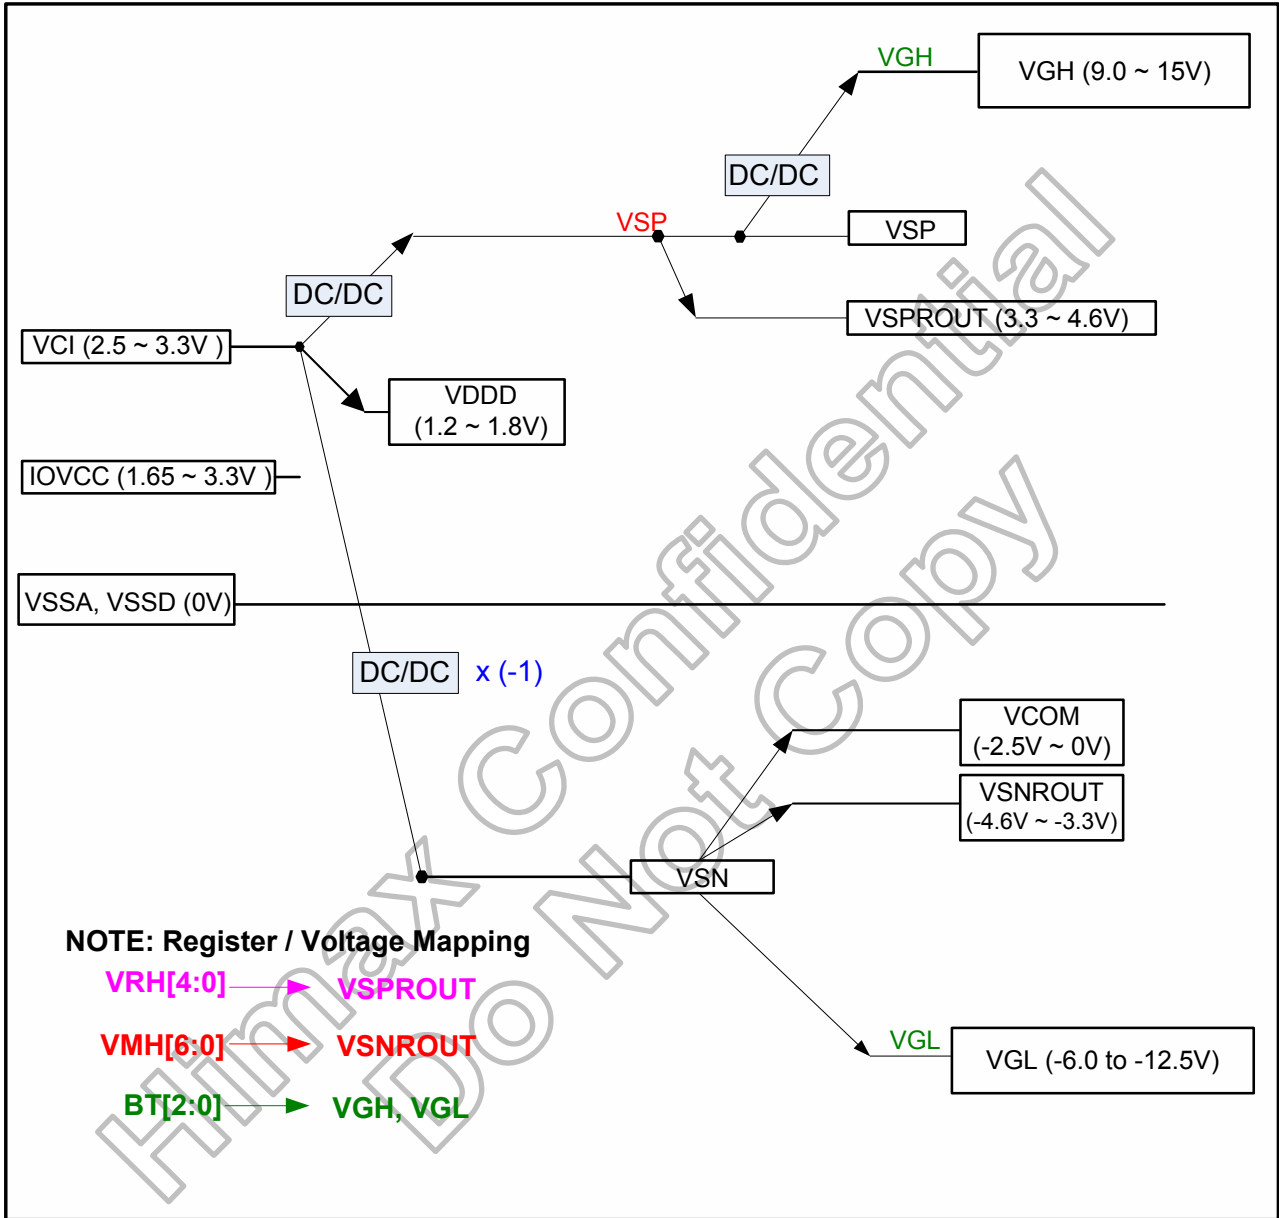

Figure 7.20 LCD power generation scheme

## 7.6 Power function

### 7.6.1 Power on/off sequence

Power source IOVCC, VCI can be applied and powered down in any order.  
IOVCC, VCI can be powered down in any order.

During power off, if LCD is in the Sleep Out mode, IOVCC, VCI must be powered down minimum 120msec after NRESET has been released.

During power off, if LCD is in the Sleep In mode, IOVCC, VCI can be powered down minimum 0msec after NRESET has been released.

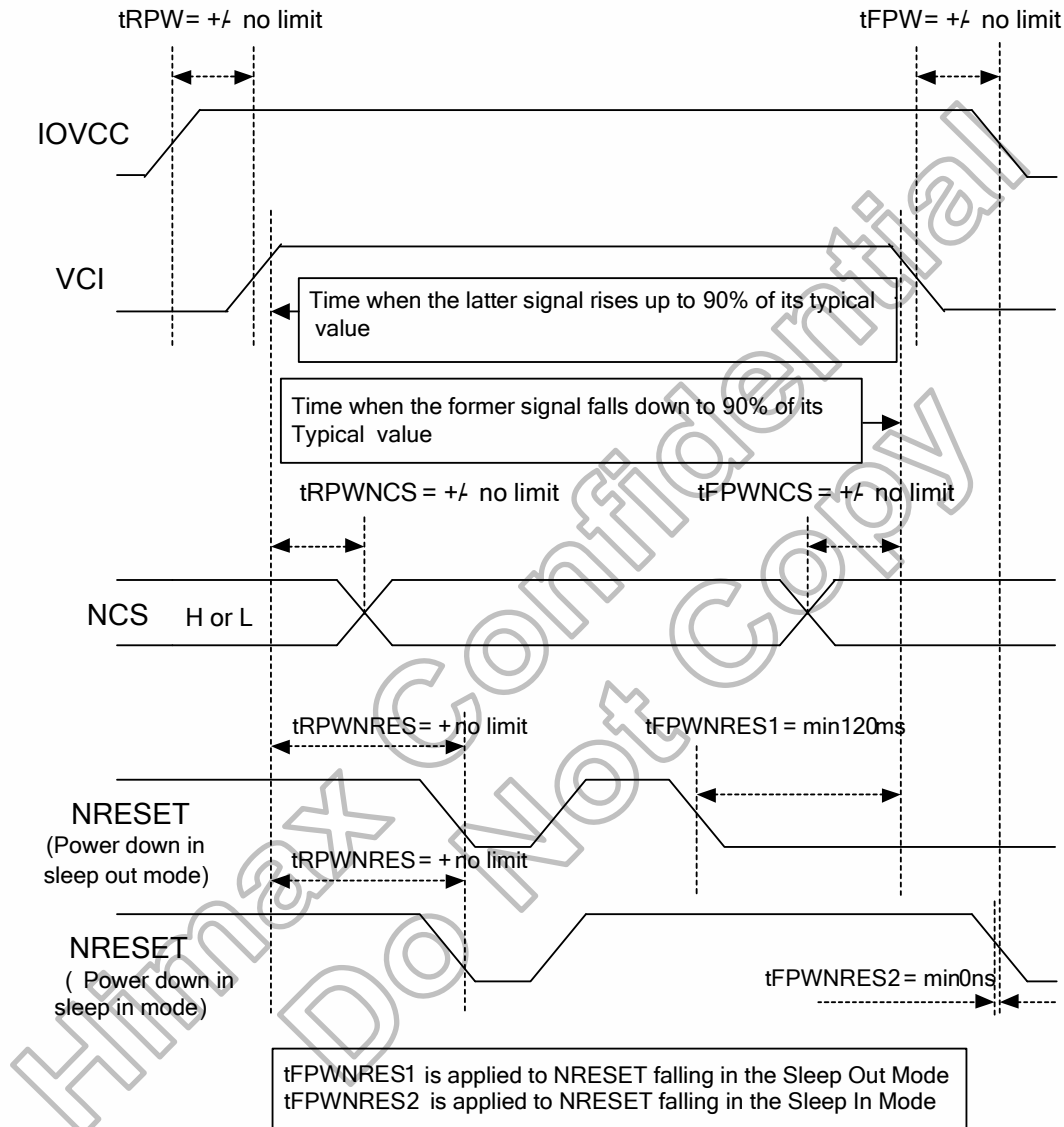

NCS can be applied at any timing or can be permanently grounded. NRESET has priority over NCS.

- Note:** (1) There will be no damage to the display module if the power sequences are not met.  
(2) There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.  
(3) There will be no abnormal visible effects on the display between end of Power on Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.  
(4) If NRESET line is not held stable by host during Power on Sequence as defined in Sections 7.5.1.1 and 7.5.1.2, then it will be necessary to apply a Hardware Reset (NRESET) after Host Power on Sequence to ensure correct operation. Otherwise correct function is not guaranteed.

If NRESET line is not held stable by host during Power on Sequence as defined in Sections 7.5.1.1 and 7.5.1.2, then it will be necessary to apply a Hardware Reset (NRESET) after Host Power on Sequence is complete to ensure correct operation, otherwise correct functionality is not guaranteed. The power on/off sequence is illustrated as below.

**7.6.1.1 Case 1 – NRESET line is held high or unstable by host at power on**

If NRESET line is held high or unstable by the host during Power On, then a Hardware Reset must be applied after both IOVCC, VCI have been applied, otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

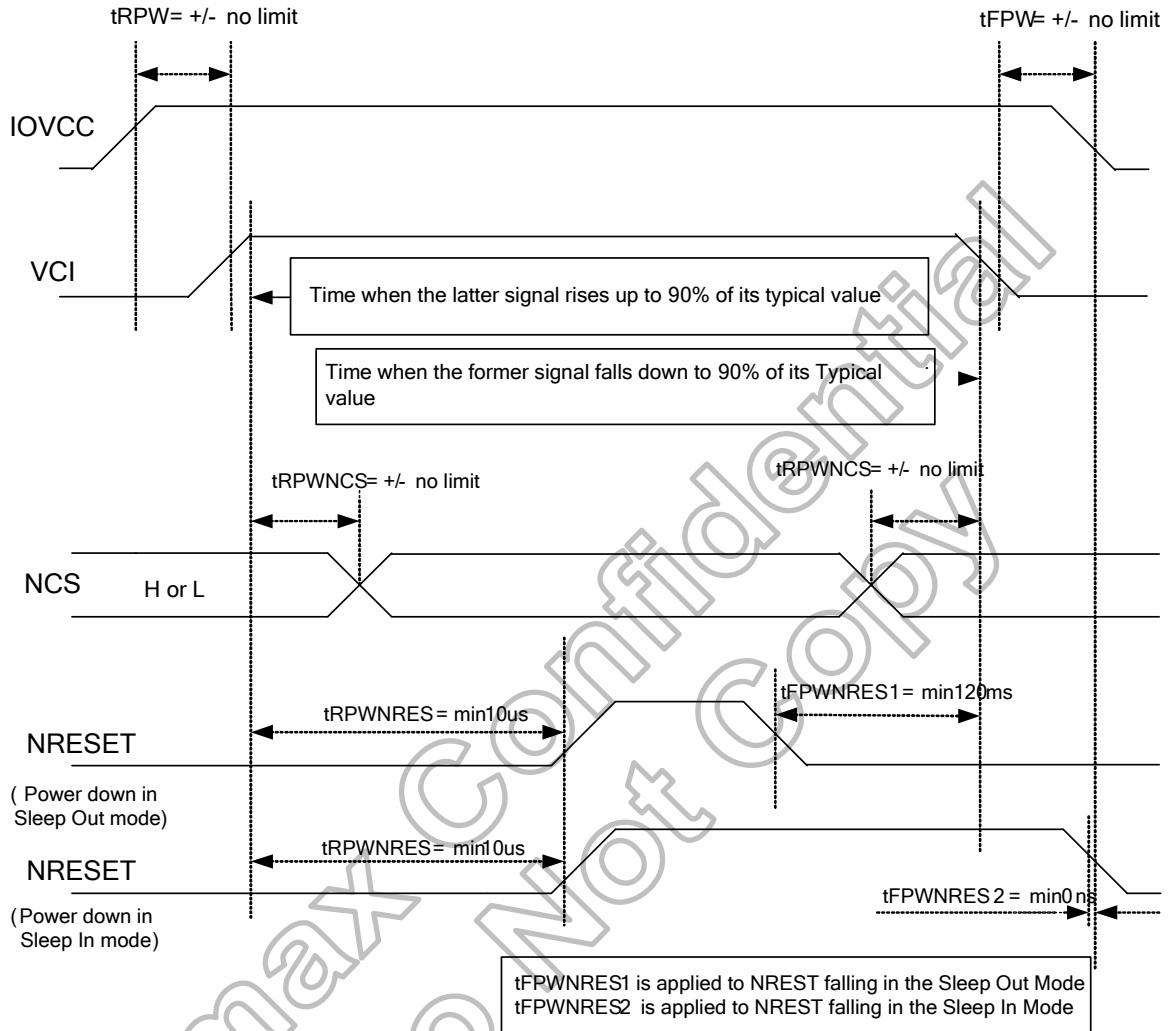

**Note:** Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

**Figure 7.21 Case 1 – NRESET line is held high or unstable by host at power on**

**7.6.1.2 Case 2 – NRESET line is held low by host at power on**

If NRESET line is held Low (and stable) by the host during Power On, then the NRESET must be held low for minimum 10µsec after VCI have been applied.

**Note:** Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

**Figure 7.22 NRESET Line is Held Low by Host at Power On**

7.6.2 Power levels definition

## 7.7 Sleep out – command and self-diagnostic functions of display module

### 7.7.1 Register loading detection

Sleep Out-command (See section 8.2.12 “Sleep Out (11h)”) is a trigger for an internal function of the display module, which indicates, if the display module loading function of factory default values from EEPROM (or similar device) to registers of the display controller is working properly.

There are compared factory values of the EEPROM and register values of the display controller by the display controller. If those both values (EEPROM and register values) are the same, there is an inverted (=increased by 1) bit, which is defined in section 8.2.10 “Read Display Self-Diagnostic Result (0Fh)” (=RDDSDR) (The bit used for this command is D7). If those both values are not the same, this bit (D7) is not inverted (= increased by 1). The flow chart for this internal function is shown as below.

**Note:** There is not compared and loaded register values, which can be changed by User (User area commands: 00h to AFh and DAh to DDh), by the display module.

**Figure 7.25 RDDSDR register loading detection flow**

**7.7.2 Functionality detection**

Sleep Out-command (See section 8.2.12 “Sleep Out (11h)”) is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements.

The internal function (= the display controller) is comparing, if the display module is still meeting functionality requirements (e.g. booster voltage levels, timings, etc.) If functionality requirement is met, there is an inverted (= increased by 1) bit, which defined in section 8.2.10 “Read Display Self- Diagnostic Result (0Fh)” (= RDDSDR) (The used bit of this command is D6). If functionality requirement is not same, this bit (D6) is not inverted (= increased by 1). The flow chart for this internal function is shown as below.

**Note:** There is needed 120msec after Sleep Out -command, when there is changing from Sleep In –mode to Sleep Out -mode, before there is possible to check if User’s functionality requirements are met and a value of RDDSDR’s D6 is valid. Otherwise, there is 5msec delay for D6’s value, when Sleep Out –command is sent in Sleep Out -mode.

**Figure 7.26 Functionality detection flow**

## 7.8 Input / output pin state

### 7.8.1 Output pins

| Output or Bi-directional pins  | After Power On    | After Hardware Reset | After Software Reset |
|--------------------------------|-------------------|----------------------|----------------------|
| TE                             | Low               | Low                  | Low                  |
| DB17 to DB0<br>(Output driver) | High-Z (Inactive) | High-Z (Inactive)    | High-Z (Inactive)    |
| VTESTOUT<br>NVTESTOUT          | Low               | Low                  | Low                  |

**8.2.2 Software reset (01h)**

|                         |  |     |     |       |    |     |               |    |    |    |    |    |     |
|-------------------------|--|-----|-----|-------|----|-----|---------------|----|----|----|----|----|-----|
| <b>01 H</b>             | <b>SWRESET (Software Reset)</b>  |     |     |       |    |     |               |    |    |    |    |    |     |
|                         | DNC  | NWR | NRD | D17-8 | D7 | D6  | D5            | D4 | D3 | D2 | D1 | D0 | HEX |
| Command                 | 0  | ↑   | 1   | -     | 0  | 0   | 0             | 0  | 0  | 0  | 0  | 1  | 01  |
| Parameter               | NO PARAMETER   |     |     |       |    |     |               |    |    |    |    |    |     |
| Description             | <p>When the Software Reset command is written, it causes a software reset. It resets the commands and parameters to their S/W Reset default values. (See default tables in each command description.)<br/>                     The display is blank immediately.<br/>                     Note: The GRAM contents are unaffected by this command.</p>  |     |     |       |    |     |               |    |    |    |    |    |     |
| Restriction             | <p>It will be necessary to wait 5m sec before sending new command following software reset. The display module loads all display suppliers' factory default values to the registers during this 5m sec.<br/>                     If SW Reset is applied during Sleep Out mode, it will be necessary to wait 120m sec before sending Sleep Out command.<br/>                     SW Reset command cannot be sent during Sleep Out sequence.</p> |     |     |       |    |     |               |    |    |    |    |    |     |
| Register Availability   | Status   |     |     |       |    |     | Availability  |    |    |    |    |    |     |

| 3 <sup>rd</sup> parameter | 1                           | 1   | ↑   | -     | 0   | D22 | D21 | D20 | D19 | D18 | D17 | D16 | -   |
| 4 <sup>th</sup> parameter | 1                           | 1   | ↑   | -     | D15 | 0   | D13 | 0   | 0   | D10 | D9  | D8  | -   |
| 5 <sup>th</sup> parameter | 1                           | 1   | ↑   | -     | D7  | D6  | D5  | D4  | D3  | D2  | D1  | 0   | -   |

This command indicates the current status of the display as described in the table below:

| Bit | Description                               | Comment    |
|-----|---|------------|
| D31 | Booster Voltage Status                    | -          |
| D30 | Page Address Order (MY)                   | -          |
| D29 | Column Address Order (MX)                 | -          |
| D28 | Page/Column Order (MV)                    | -          |
| D27 | Line Address Order (ML)                   | -          |
| D26 | RGB/BGR Order                             | -          |
| D25 | Display Data Latch Order                  | -          |
| D24 | Switching between Segment outputs and RAM | Set to '0' |
| D23 | Switching between Common outputs and RAM  | Set to '0' |
| D22 | Interface Color Pixel Format Definition   | -          |
| D21 |   | -          |
| D20 |   | -          |
| D19 |   | -          |
| D18 | Idle Mode On/Off                          | -          |
| D17 | Partial Mode On/Off                       | -          |
| D16 | Sleep In/Out                              | -          |
| D15 | Display Normal Mode On/Off                | -          |
| D14 | Vertical Scrolling Status                 | -          |
| D13 | Horizontal Scrolling Status               | Set to '0' |
| D12 | Inversion Status                          | -          |
| D11 | All Pixels On                             | Set to '0' |
| D10 | All Pixels Off                            | Set to '0' |
| D9  | Display On/Off                            | -          |
| D8  | Tearing Effect Line On/Off                | -          |
| D7  | Gamma Curve Selection                     | -          |
| D6  |   | -          |
| D5  |   | -          |
| D4  | Tearing Effect Output Line Mode           | -          |
| D3  | Horizontal Sync. (HS, RGB I/F)            | Set to '0' |
| D2  | Vertical Sync. (VS, RGB I/F)              | Set to '0' |
| D1  | Pixel Clock (DOTCLK, RGB I/F)             | Set to '0' |
| D0  | Data Enable (DE, RGB I/F)                 | Set to '0' |
| D0  | Parity Error                              | Set to '0' |

Bit Values are explained overleaf.

Bit D31 – Booster Voltage Status  
 '0' = Booster Off or has a fault.  
 '1' = Booster On and working OK.

Bit D30 – Page Address Order  
 '0' = Top to Bottom (When MADCTL B7(MY) = '0').  
 '1' = Bottom to Top (When MADCTL B7(MY) = '1').

Bit D29 – Column Address Order  
 '0' = Left to Right (When MADCTL B6(MX) = '0').  
 '1' = Right to Left (When MADCTL B6(MX) = '1').

Bit D28 – Page / Column Order  
 '0' = Normal Mode (When MADCTL B5(MV) = '0').

'1' = Reverse Mode (When MADCTL B5(MV) = '1').  
 Bit D27 – Line Address Order  
 '0' = LCD Refresh Top to Bottom (When MADCTL B4(ML) = '0').  
 '1' = LCD Refresh Bottom to Top (When MADCTL B4(ML) = '1').  
 Bit D26 – RGB/BGR Order  
 '0' = RGB (When MADCTL B3 = '0').  
 '1' = BGR (When MADCTL B3 = '1').  
 Bit D25 – Display Data Latch Order  
 '0' = LCD Refresh Left to Right (When MADCTL B2 = '0').  
 '1' = LCD Refresh Right to Left (When MADCTL B2 = '1').  
 Note : For bits D27, D26 and D25 also refer to 8.3.29 Memory Access Control (R36h)  
 Bit D24 – Switching Between Segment Outputs and RAM  
 This bit is not applicable for this project, so it is set to '0'.  
 Bit D23 – Switching Between Common Outputs and RAM  
 This bit is not applicable for this project, so it is set to '0'.  
 Bits D22, D21, D20 –Interface Color Pixel Format Definition

| Interface Format | D22 | D21 | D20 |
|------------------|-----|-----|-----|
| Not Defined      | 0   | 0   | 0   |
| Not Defined      | 0   | 0   | 1   |
| Not Defined      | 0   | 1   | 0   |
| 12 bit/pixel     | 0   | 1   | 1   |
| Not Defined      | 1   | 0   | 0   |
| 16 bit/pixel     | 1   | 0   | 1   |
| 18 bit/pixel     | 1   | 1   | 0   |
| Not Defined      | 1   | 1   | 1   |

Bit D19 – Idle Mode On/Off  
 '0' = Idle Mode Off.  
 '1' = Idle Mode On.  
 Bit D18 – Partial Mode On/Off  
 '0' = Partial Mode Off.  
 '1' = Partial Mode On.  
 Bit D17 – Sleep In/Out  
 '0' = Sleep In Mode.  
 '1' = Sleep Out Mode.  
 Bit D16 – Display Normal Mode On/Off  
 '0' = Display Normal Mode Off.  
 '1' = Display Normal Mode On.  
 Bit D15 – Vertical Scrolling On/Off  
 '0' = Vertical Scrolling is Off.  
 '1' = Vertical Scrolling is On.  
 Bit D14 – Horizontal Scrolling Status  
 This bit is not applicable for this project, so it is set to '0'.  
 Bit D13 – Inversion On/Off  
 '0' = Inversion is Off.  
 '1' = Inversion is On.  
 Bit D12 – All Pixels On  
 This bit is not applicable for this project, so it is set to '0'.  
 Bit D11 – All Pixels Off  
 This bit is not applicable for this project, so it is set to '0'.  
 Bit D10 – Display On/Off  
 '0' = Display is Off.  
 '1' = Display is On.  
 Bit D9 – Tearing Effect Line On/Off  
 '0' = Tearing Effect Line Off.  
 '1' = Tearing Effect On.

Bits D8, D7, D6 – Gamma Curve Selection

| Gamma Curve Selected | B8 | B7 | B6 | Gamma Set (26h) Parameter |
|----------------------|----|----|----|---------------------------|
| Gamma Curve 1        | 0  | 0  | 0  | GC0                       |
| Gamma Curve 2        | 0  | 0  | 1  | GC1                       |
| Gamma Curve 3        | 0  | 1  | 0  | GC2                       |
| Gamma Curve 4        | 0  | 1  | 1  | GC3                       |
| Not Defined          | 1  | 0  | 0  | Not Defined               |
| Not Defined          | 1  | 0  | 1  | Not Defined               |
| Not Defined          | 1  | 1  | 0  | Not Defined               |
| Not Defined          | 1  | 1  | 1  | Not Defined               |

Bit D5 – Tearing Effect Line Output Mode.

'0' = Mode 1, V-Blanking only.

'1' = Mode 2, both H-Blanking and V-Blanking.

Bit D4 – Horizontal Sync. (HS) RGB I/F On/Off, Note

This bit is not applicable for this project, so it is set to '0'.

Bit D3 – Vertical Sync. (VS) RGB I/F On/Off, Note

This bit is not applicable for this project, so it is set to '0'.

Bit D2 – Pixel Clock (DOTCLK) RGB I/F On/Off, Note

This bit is not applicable for this project, so it is set to '0'.

Bit D1 – Data Enable (DE) RGB I/F On/Off, Note

This bit is not applicable for this project, so it is set to '0'.

Bit D0 – Parity Error

This bit is not applicable for this project, so it is set to '0'.

| Flow Chart                                | <p>The flow chart illustrates the sequence of operations for the RDDSM (0Eh) command. It is divided into two modes: Serial I/F Mode and Parallel I/F Mode. A dashed line separates the Host from the Driver. In Serial I/F Mode, the Host sends the RDDSM (0Eh) command to the Driver, which then sends data D[7:0]. In Parallel I/F Mode, the Host sends the RDDSM (0Eh) command to the Driver, which performs a Dummy Read before sending data D[7:0]. A legend on the right defines the symbols used: Command (trapezoid), Parameter (parallelogram), Display (hexagon), Action (hexagon), Mode (rounded rectangle), and Sequential transfer (oval).</p>  |     |     |       |    |    |    |    |    |    |    |    |     |        |               |  |     |   |     |   |     |  |     |                         |     |

| Description             | <p>This command turns off sleep mode. In this mode the DC/DC converter is enabled, Internal oscillator is started, and panel scanning is started.</p>    |     |               |       |    |    |    |    |    |    |    |    |     |
|                         | <p>This command has no effect when module is already in sleep out mode. Sleep Out Mode can only be left by the Sleep In Command (10h). It will be necessary to wait 5msec before sending next command, this is to allow time for the supply voltages and clock circuits to stabilize. The display module loads all display suppliers' factory default values to the registers during this 5msec and there cannot be any abnormal visual effect on the display image. If factory default and register values are same when this load is done and when the display module is already Sleep Out -mode. The display module is doing self-diagnostic functions during this 5msec. It will be necessary to wait 120msec after sending Sleep In command (when in Sleep Out mode) before Sleep Out command can be sent.</p> |     |               |       |    |    |    |    |    |    |    |    |     |

| Description                               | <p>This command is used to define area of frame memory where MCU can access. This command makes no change on the other driver status. The values of SC[15:0] and EC[15:0] are referred when RAMWR command comes. Each value represents one column line in the Frame Memory.</p> <p>(Example)</p>    |                |     |       |      |      |      |      |      |      |     |     |      |        |               |  |                   |   |                |   |                     |  |                |                         |                     |  |  |                |                |           |                |                |
| Restriction                               | <p>SC[15:0] always must be equal to or less than EC[15:0]<br/> <b>Note:</b> When SC[15:0] or EC[15:0] is greater than maximum address like below, data out of range will be ignored<br/>                     0000h ≤ SC[15:0] ≤ EC[15:0] ≤ 0083h, when MADCTL's B5=0<br/>                     0000h ≤ SC[15:0] ≤ EC[15:0] ≤ 00A1h, when MADCTL's B5=1</p>  |                |     |       |      |      |      |      |      |      |     |     |      |        |               |  |                   |   |                |   |                     |  |                |                         |                     |  |  |                |                |           |                |                |

| Description                               | <p>This command is used to define area of frame memory where MCU can access. This command makes no change on the other driver status. The values of SP[15:0] and EP[15:0] are referred when RAMWR command comes. Each value represents one Page line in the Frame Memory.</p> <p style="text-align: center;">(Example)</p> <div style="text-align: center;">  </div>  |                |     |       |      |      |      |      |      |      |     |     |      |        |               |  |                   |   |                |   |                     |  |                |                         |                     |  |                |                |           |                |                |
| Restriction                               | <p>SP[15:0] always must be equal to or less than EP[15:0]<br/> <b>Note:</b> When SP[15:0] or EP[15:0] is greater than maximum row address like below, data of out of range will be ignored<br/>                     0000h ≤ SP[15:0] ≤ EP[15:0] ≤ 00A1h (When MADCTL's B5=0)<br/>                     0000h ≤ SP[15:0] ≤ EP[15:0] ≤ 0083h (When MADCTL's B5=1)</p>   |                |     |       |      |      |      |      |      |      |     |     |      |        |               |  |                   |   |                |   |                     |  |                |                         |                     |  |                |                |           |                |                |

| Description                               | <p>This command is used to transfer data from MCU to frame memory. This command makes no change to the other driver status. When this command is accepted, the column register and the page register are reset to the Start Column/Start Page positions. The Start Column/Start Page positions are different in accordance with MADCTL setting. (See 6.2) Then D[7:0] is stored in frame memory and the column register and the page register incremented. Sending any other command can stop frame Write.</p> |     |     |          |    |    |    |    |    |    |    |    |        |        |               |  |                                    |   |                                   |   |                                   |  |     |                         |     |

| Description                | This command is used to define the LUT for 12bit-to-18bit/16bit-to-18bit color depth conversions. (See also section 5.2) 128 bytes must be written to the LUT regardless of the color mode. This command has no effect on other commands/parameters and Contents of frame memory. Visible change takes effect next time the Frame Memory is written to. |     |     |     |     |      |   |      |      |      |      |        |

| 6 <sup>th</sup> parameter | 1   | ↑   | 1   | -     | BFA 7  | BFA 6  | BFA 5  | BFA 4  | BFA 3  | BFA 2  | BFA 1 | BFA 0 | 00A2  |
| Description               | <p>This command defines the Vertical Scrolling Area of the display. When MADCTL B4=0, the 1<sup>st</sup> &amp; 2<sup>nd</sup> parameter TFA[15:0] describes the Top Fixed Area (in No. of lines from top of the Frame Memory and Display). The 3<sup>rd</sup> &amp; 4<sup>th</sup> parameter VSA[15:0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the bottom most line of the Top Fixed Area. The 5<sup>th</sup> &amp; 6<sup>th</sup> parameter BFA[15:0] describes the Bottom Fixed Area (in No. of lines from Bottom of the Frame Memory and Display). TFA, VSA and BFA refer to the Frame Memory Line Pointer.</p> |     |     |       |        |        |        |        |        |        |       |       |       |
|                           | <p>When MADCTL B4=1<br/>                     The 1<sup>st</sup> &amp; 2<sup>nd</sup> parameter TFA[15:0] describes the Top Fixed Area (in No. of lines from bottom of the Frame Memory and Display). The 3<sup>rd</sup> &amp; 4<sup>th</sup> parameter VSA[15:0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address). The first line read from Frame Memory appears immediately after the top most line of the Top Fixed Area. The 5<sup>th</sup> &amp; 6<sup>th</sup> parameter BFA[15:0] describes the Bottom Fixed Area (in No. of lines from Top of the Frame Memory and Display).</p>  |     |     |       |        |        |        |        |        |        |       |       |       |
| Restriction               | The condition is (TFA+VSA+BFA)=162, otherwise Scrolling mode is undefined. In Vertical Scroll Mode, MADCTL B5 should be set to '0' – this only affects the Frame Memory Write.  |     |     |       |        |        |        |        |        |        |       |       |       |

This command defines read/write scanning direction of frame memory.  
 This command makes no change on the other driver status.  
 Bit Assignment

| Bit | Name                  | Description  |
|-----|-----------------------|--|
| MY  | PAGE ADDRESS ORDER    | These 3 bits controls MCU to memory write/read direction. See Section 6.2.1 "MCU to memory write/read direction" |
| MX  | COLUMN ADDRESS ORDER  |  |
| MV  | PAGE/COLUMN SELECTION |  |
| ML  | Vertical ORDER        | LCD vertical refresh direction control   |
| BGR | RGB-BGR ORDER         | Color selector switch control (0=RGB color filter panel, 1=BGR color filter panel)                               |
| SS  | Horizontal ORDER      | LCD horizontal refresh direction control   |

| Description                              | <p>This command is used to enter into Idle mode on.<br/>                 In the idle on mode, color expression is reduced. The primary and the secondary colors using MSB of each R, G and B in the Frame Memory, 8 color depth data is displayed.</p> <p>(Example)</p>  |                |                |                |                |                |                |                |                |                |                |                |                |                                   |                |  |                |   |               |   |               |  |        |                         |      |  |                     |                |                |                |                |                |                |                |                |                |                |                |                |                |                |                |                |                |                |       |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |      |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |       |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |      |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |        |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |       |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

| Description               | <p><b>DP_STB, DP_STB_S</b> : These two bits can let the driver into the deep standby mode. And when into deep standby, all display operation stops, including the internal R-C oscillator. In the deep standby mode, the GRAM data and register content are not retained.</p> <p><b>BT[2:0]</b>: Switch the output factor of step-up circuit 2 for VGH and VGL voltage generation. The LCD drive voltage level can be selected according to the characteristic of liquid crystal which panel used. Lower amplification of the step-up circuit consumes less current and then the power consumption can be reduced.</p> <table border="1"> <thead> <tr> <th>BT2</th> <th>BT1</th> <th>BT0</th> <th>VSP</th> <th>VSN</th> <th>VGH</th> <th>VGL</th> </tr> </thead> <tbody> <tr><td>0</td><td>0</td><td>0</td><td>5.0V</td><td>-5.0V</td><td>14.8V</td><td>-12.5V</td></tr> <tr><td>0</td><td>0</td><td>1</td><td>5.0V</td><td>-5.0V</td><td>14.8V</td><td>-10.1V</td></tr> <tr><td>0</td><td>1</td><td>0</td><td>5.0V</td><td>-5.0V</td><td>14.8V</td><td>-7.5V</td></tr> <tr><td>0</td><td>1</td><td>1</td><td>5.0V</td><td>-5.0V</td><td>12.5V</td><td>-12.5V</td></tr> <tr><td>1</td><td>0</td><td>0</td><td>5.0V</td><td>-5.0V</td><td>12.5V</td><td>-10.1V</td></tr> <tr><td>1</td><td>0</td><td>1</td><td>5.0V</td><td>-5.0V</td><td>12.5V</td><td>-7.5V</td></tr> <tr><td>1</td><td>1</td><td>0</td><td>5.0V</td><td>-5.0V</td><td>10.0V</td><td>-10.1V</td></tr> <tr><td>1</td><td>1</td><td>1</td><td>5.0V</td><td>-5.0V</td><td>10.0V</td><td>-7.5V</td></tr> </tbody> </table> <p><b>Note:</b> When VCI = 2.8V, TRI=0, @ IVGH=50uA, IVGL=-50uA</p> <p><b>VRH[5:0]</b>: Specify the VSPROUT voltage adjusting. VSPROUT voltage is for gamma voltage setting. <math>VSPROUT = \text{Decimal}(VRH[5:0]) \times 0.05 + 3.3</math>. The default value is 1Bh(27x0.05+3.3=4.65V)</p> <table border="1"> <thead> <tr> <th>VRH5</th> <th>VRH4</th> <th>VRH3</th> <th>VRH2</th> <th>VRH1</th> <th>VRH0</th> <th>VSPROUT (TRI=0)</th> </tr> </thead> <tbody> <tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>3.30</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>3.35</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>3.40</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>3.45</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>0</td><td>3.50</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td><td>1</td><td>3.55</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>0</td><td>3.60</td></tr> <tr><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td><td>1</td><td>3.65</td></tr> <tr><td>:</td><td>:</td><td>:</td><td>:</td><td>:</td><td>:</td><td>:</td></tr> <tr><td>0</td><td>1</td><td>1</td><td>0</td><td>0</td><td>1</td><td>4.55</td></tr> <tr><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>0</td><td>4.6</td></tr> <tr><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>1</td><td>STOP</td></tr> <tr><td>0</td><td>1</td><td>1</td><td>1</td><td>0</td><td>0</td><td>STOP</td></tr> <tr><td>:</td><td>:</td><td>:</td><td>:</td><td>:</td><td>:</td><td>:</td></tr> <tr><td>1</td><td>1</td><td>1</td><td>1</td><td>0</td><td>1</td><td>STOP</td></tr> <tr><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>0</td><td>STOP</td></tr> <tr><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>1</td><td>Internal circuit operations stop. The gamma voltage can be adjusted from external VSPROUT input. |           |    |    |         |        |          |      |     |     |     |     |     |     |     |   |   |   |      |       |       |        |   |   |   |      |       |       |        |   |   |   |      |       |       |       |   |   |   |      |       |       |        |   |   |   |      |       |       |        |   |   |   |      |       |       |       |   |   |   |      |       |       |        |   |   |   |      |       |       |       |      |      |      |      |      |      |                 |   |   |   |   |   |   |      |   |   |   |   |   |   |      |   |   |   |   |   |   |      |   |   |   |   |   |   |      |   |   |   |   |   |   |      |   |   |   |   |   |   |      |   |   |   |   |   |   |      |   |   |   |   |   |   |      |   |   |   |   |   |   |   |   |   |   |   |   |   |      |   |   |   |   |   |   |     |   |   |   |   |   |   |      |   |   |   |   |   |   |      |   |   |   |   |   |   |   |   |   |   |   |   |   |      |   |   |   |   |   |   |      |   |   |   |   |   |   |  |

**NVRH[5:0]:** Specify the VSNR voltage adjusting. VSNR voltage is for gamma voltage setting.  $VSNR = \text{Decimal}(-3.3 - nVNRH[5:0]) \times 0.05$ . The default value is 1Bh  $(-3.3 - 27 \times 0.05 = -4.65V)$

| 1     | 1     | 1     | 1     | 1     | 1     | Internal circuit operations stop. The gamma voltage can be adjusted from external VSNR input. |

**Note :** Please make sure  $VSNR = VSN + 0.2V$

**AP[2:0]:** Adjust the amount of current driving for the operational amplifier in the power supply circuit. When the amount of fixed current is increased, the LCD driving capacity and the display quality are high, but the current consumption is increased. Adjust the fixed current by considering both the display quality and the current consumption.

| AP2 | AP1 | AP0 | Constant Current of Operational Amplifier    |
|-----|-----|-----|--|

This command is used to set display related register

**D[1:0]:** When D1 = '1', display is on; when D1 = '0', display is off. When display is off, the display data is retained in the GRAM and the entire source outputs are set to the VSSD level.

When D[1:0]= '01', the internal display of the HX8353-E is performed although the actual display is off. When D[1:0]= '00', the internal display operation halts and the display is off.

| D1 | D0 | Source Output | Internal Display Operations | Gate-Driver Control Signals |
|----|----|---------------|-----------------------------|-----------------------------|
| 0  | 0  | VSSD          | Halt                        | Halt                        |
| 0  | 1  | VSSD          | Operate                     | Operate                     |
| 1  | 0  | =PT(0,0)      | Operate                     | Operate                     |
| 1  | 1  | Display       | Operate                     | Operate                     |

**GON, DTE:**

| GON | DTE | Gate Output                |
|-----|-----|----------------------------|
| 0   | x   | Fixed to VGH               |
| 1   | 0   | Fixed to VGL               |
| 1   | 1   | Normal Operation (VGH/VGL) |

**PT[1:0] :** Specify the Non-display area source output in partial display mode.

Description

| REV_Panel                   | GRAM Data              | Source Output Level |             |                  |     |             |             | GND | Hi-z |

**N\_DUM[7:0]:** Specify dummy line number in blanking area of one frame in Normal / Partial mode for internal operation.  
**I\_DUM[7:0]:** Specify dummy line number in blanking area of one frame in Idle (8-color) / Partial Idle mode for internal operation.

| DUM[7:0] | Line number in blanking period |
|----------|--------------------------------|

**Formula for the Frame Frequency during internal display mode:**

Frame frequency =  $f_{osc} / (RTN \times DIV \times (162 + DUM))$  [Hz]

Fosc : RC oscillation frequency

**GDON[7:0]:** Specify the valid gate output start time in 1-line driving period. The period time value is defined as SYSCLK number in internal clock display mode. The period time value is defined as DOTCLK number in 18/16-bit bus width RGB display mode and is defined as DOTCLK/3 number in 6-bit bus width RGB display mode. (Please note that the setting "00h", "01h", "02h" is inhibited).

**GDOF[7:0]:** Specify the gate output end time in 1-line driving period. The period time value is defined as SYSCLK number in internal clock display mode. The period time value is defined as DOTCLK number in 18/16-bit bus width RGB display mode and is defined as DOTCLK/3 number in 6-bit bus width RGB display mode. (Please note that the  $GDON[7:0] + 1 \leq GDOF[7:0] \leq RTN - 1$ ).

**L\_BASE[7:0]:** Basic line clock number. Internal line clock =  $L\_BASE[7:0] + RTN[3:0]$ .

**Restrictions** If EXTC is high or enable SETEXTC command (even EXTC = low) can enable this command

Table 10.1 OTP address mapping

- Note:** (1) The same color means the same VALID bit controlled. When OTP Index programmed, the related VALID bit will be programmed to "0" automatically. If the VALID bit programmed to "0", the OTP value will be reload to related register after HW reset or SLPOUT command.
- (2) If want to program ID1~ID3, it just need to program Index 00h (ID2 and ID3 will be programmed automatically). If ID had be programmed, it also need to program Index 00h when second to eighth times programming (it will be programmed to corresponding Index automatically).
- (3) If want to program VCOM, it just need to program Index 19h. If VCOM had be programmed, it also need to program Index 19h when second to eighth times programming (it will be programmed to corresponding Index automatically).

## 11. Electrical Characteristic

### 11.1 Absolute maximum ratings

| Item                   | Symbol          | Unit | Value             | Note                     |
|------------------------|-----------------|------|-------------------|--------------------------|
| Power Supply Voltage 1 | IOVCC~VSSD      | V    | -0.3 to +4.6      | Note <sup>(1),(2)</sup>  |
| Power Supply Voltage 2 | VCI ~ VSSA      | V    | -0.3 to +4.6      | Note <sup>(3)</sup>      |
| Power Supply Voltage 3 | VSP ~ VSSA      | V    | -0.3 to +6.6      | Note <sup>(4)</sup>      |
| Power Supply Voltage 4 | VSSA ~ VSN      | V    | -0.3 to +4.6      | Note <sup>(5)</sup>      |
| Power Supply Voltage 5 | VSP ~ VSN       | V    | -0.3 to +9        | Note <sup>(6)</sup>      |
| Power Supply Voltage 6 | VGH ~ VSSA      | V    | -0.3 to +18.5     | Note <sup>(7)</sup>      |
| Power Supply Voltage 7 | VSSA ~ VGL      | V    | -16.5 to 0        | Note <sup>(8)</sup>      |
| Logic Input Voltage    | V <sub>IN</sub> | V    | -0.3 to IOVCC+0.5 | -                        |
| Logic Output Voltage   | V <sub>O</sub>  | V    | -0.3 to IOVCC+0.5 | -                        |
| Operating Temperature  | Topr            | °C   | -30 to +80        | Note <sup>(9),(10)</sup> |
| Storage Temperature    | Tstg            | °C   | -55 to +110       | Note <sup>(9),(10)</sup> |

**Note:** (1) IOVCC, VSSD must be maintained.

(2) To make sure IOVCC ≥ VSSD.

(3) To make sure VCI ≥ VSSA.

(4) To make sure VSP ≥ VSSA.

(5) To make sure VSSA ≥ VSN.

(6) To make sure VSP ≥ VSN.

(7) To make sure VGH ≥ VSSA.

(8) To make sure VSSA ≥ VGL

VGH + |VGL| < 32V

(9) For die and wafer products, specified up to +80°C.

(10) This temperature specifications apply to the TCP package.

Table 11.3 Current consumption

Typical Case:

TA = 25°C  
 IOVCC=1.8V  
 VCI = 2.8V

Worst Case:

TA = -30 to 80°C  
 IOVCC = 1.65V to 1.95V  
 VCI = 2.5V to 3.3V  
 Includes Process Variance.

11.4 AC characteristics

11.4.1 Parallel interface characteristics (8080-series MPU)

Figure 11.1 Parallel interface characteristics (8080-series MPU)

(VSSA=0V, IOVCC=1.65V to 3.3V, VCI=2.5V to 3.3V, TA = -30 to 70°C)

| Signal     | Symbol | Parameter                          | Min. | Max. | Unit | Description                 |

**11.4.3 Reset input timing**

**Figure 11.5 Reset input timing**

| Symbol | Parameter                            | Related Pins | Spec. |      |      | Note                                     | Unit |
|--------|--------------------------------------|--------------|-------|------|------|--|------|
|        |                                      |              | Min.  | Typ. | Max. |  |      |
| tRESW  | Reset low pulse width <sup>(1)</sup> | NRESET       | 10    | -    | -    | -  | μs   |
| tREST  | Reset complete time <sup>(2)</sup>   | -            | 5     | -    | -    | When reset applied during Sleep Out mode | ms   |
|        |                                      | -            | 120   | -    | -    | When reset applied during Sleep In mode  | ms   |

**Note:** (1) Spike due to an electrostatic discharge on !RES line does not cause irregular system reset according to the following table.

| NRESET Pulse           | Action         |
|------------------------|----------------|
| Shorter than 5 μs      | Reset Rejected |
| Longer than 10 μs      | Reset          |
| Between 5 μs and 10 μs | Reset Start    |

- (2) During the resetting period, the display will be blanked (The display is entering blanking sequence, which Maximum time is 120 ms, when Reset Starts in Sleep Out –mode. The display remains the blank state in Sleep In –mode) and then return to Default condition for HW reset.
- (3) During Reset Complete Time, ID2 and VCOMQF value in OTP will be latched to internal register during this period. This loading is done every time when there is HW reset complete time (tREST) within 5ms after a rising edge of NRESET.
- (4) Spike Rejection also applies during a valid reset pulse as shown as below:

- (5) It is necessary to wait 5msec after releasing NRESET before sending commands. Also Sleep Out command cannot be sent for 120msec.

### 11.5 tACC, tOH Measurement Condition

#### Measurement condition set-up

**Note:** Capacitances and resistances of the oscilloscope's probe must be included external components in these measurements
